Molecular Driving Forces Ken Dill, Sarina Bromberg, 2010-10-21 Molecular Driving Forces Second Edition E book is an introductory statistical thermodynamics text that describes the principles and forces that drive chemical and biological processes. It demonstrates how the complex behaviors of molecules can result from a few simple physical processes and how simple models provide surprisingly accurate insights into the workings of the molecular world. Widely adopted in its First Edition, Molecular Driving Forces is regarded by teachers and students as an accessible textbook that illuminates underlying principles and concepts. The Second Edition includes two brand new chapters: 1 Microscopic Dynamics introduces single molecule experiments and 2 Molecular Machines considers how nanoscale machines and engines work. The Logic of Thermodynamics has been expanded to its own chapter and now covers heat work processes, pathways, and cycles. New practical applications, examples, and end of chapter questions are integrated throughout the revised and updated text, exploring topics in biology, environmental and energy science, and nanotechnology. Written in a clear and reader friendly style, the book provides an excellent introduction to the subject for novices while remaining a valuable resource for experts.

Equilibrium And Non-equilibrium Statistical Mechanics (New And Revised Printing) Carolyn M Van Vliet, 2008-06-11 This book encompasses our current understanding of the ensemble approach to many-body physics, phase transitions, and other thermal phenomena, as well as the quantum foundations of linear response theory, kinetic equations, and stochastic processes. It is destined to be a standard text for graduate students, but it will also serve the specialist researcher in this fascinating field. Some more elementary topics have been included in order to make the book self-contained. The historical methods of J Willard Gibbs and Ludwig Boltzmann, applied to the quantum description rather than phase space, are featured. The tools for computations in the microcanonical, canonical, and grand canonical ensembles are carefully developed and then applied to a variety of classical and standard quantum situations. After the language of second quantization has been introduced, strongly interacting systems such as quantum liquids, superfluids, and superconductivity are treated in detail. For the connoisseur, there is a section on diagrammatic methods and applications. In the second part, dealing with non-equilibrium processes, the emphasis is on the quantum foundations of Markovian behaviour and irreversibility via the Pauli-Van Hove master equation. Justifiable linear response expressions and the quantum Boltzmann approach are discussed and applied to various condensed matter problems. From this basis, the Onsager-Casimir relations are derived together with the mesoscopic master equation, the Langevin equation, and the Fokker-Planck truncation procedure. Brownian motion and modern stochastic problems such as fluctuations in optical signals and radiation fields briefly make the round. **Statistical**
