McPherson,2016-08-31 To interpret the laboratory results To distinguish the normal from the abnormal and to understand the merits and demerits of the assays under study The book attempts to train a laboratory medicine student to achievesound knowledge of analytical methods and quality control practices tointerpret the laboratory results to distinguish the normal from the abnormaland to understand the merits and demerits of the assays under study Circulating levels and assessment of clinical laboratory analytes, in

>80-year-old, apparently healthy, moderately healthy, and frail individuals Maria Edvardsson, 2019-09-09 Blood samples are often used to investigate the possible presence of disease and to make treatment decisions. In the interpretation of the results, comparison either with previous values from the same individual or with a set of appropriate group based reference intervals are used. Current reference intervals for common laboratory analytes are often based on measurements from apparently healthy persons aged 18-65 years. Age is accompanied by a general decline in organ functions and it is difficult to determine whether a change in levels of laboratory analytes in an elderly individual can be attributed to age alone independent of environmental or disease processes. Frailty can be seen as a consequence of age related multifactorial deterioration, physical, cognitive and sensory, resulting in vulnerability and lack of adaptability to internal stressors such as infection or new medication and/or external stressors such as fall at home. Consensus about the definition of frail and frailty is missing both nationally and internationally; the question arises whether different definitions of frailty affect the interpretation of analytes when comparing different groups of elderly. The overarching aim of the thesis was to interpret and assess circulating levels of some clinical laboratory analytes in relation to conventional reference values in 80-year-old apparently healthy, moderately healthy and frail individuals. Data originated from other studies in which blood samples were collected from individuals 80-year-old. Comparisons in Paper I of levels of some laboratory analytes from 138 nursing home residents (NHRs) was made with blood from reference populations both blood donor and the NORIP study. The results indicated differences for some immunological complement factor 3 and 4, immunoglobulin G and M and chemical analytes alanine aminotransferase (ALT), phosphate, albumin, sodium, creatinine and urea, but no differences in levels occurred for aspartate aminotransferase (AST), gamma glutamyltransferase (GT) or lactate dehydrogenase (LDH). It was unclear whether the differences were due to differences in age between the elderly and the reference populations or whether the elderly individuals had chronic diseases and were on medication. In Paper II, 569 individuals (elderly individuals 80 years old) were classified as healthy, moderately healthy and frail based on diseases, medications and physical and cognitive abilities. Statistical differences between the groups were found for the investigated analytes albumin, ALT, AST, creatinine and GT. In Paper IV, individuals from Paper II (n=569) were divided into two groups and thereafter divided into apparently healthy, moderately healthy and frail. One group was subdivided into apparently healthy, moderately healthy and frail based on physical and cognitive abilities and the other group was divided based on the frailty index (FI). There was no statistical difference found between apparently healthy and moderately healthy groups regardless of classification model used. Among frail individuals, differences in levels occurred for three out of the five investigated analytes: ALT, creatinine and GT, with lower levels occurring when the FI classification model was used. No differences in levels occurred for albumin or AST in frail individuals regardless of classification model used. The aim of Paper III was to study whether 1-year changes in complete blood count (CBC) including haemoglobin (Hb), red blood cell (RBC), erythrocyte volume fraction (EVF), mean corpuscular volume (MCV), mean corpuscular Hb concentration (MCHC)
