Cytokines and Growth Factors in Blood Transfusion C.Th. Smit Sibinga,P.C. Das,B. Löwenberg,2012-12-06

Cytokines are cellular growth factors which also provide communication between cells and their milieu This clearly is an exciting area in modern medicine that will have significant impact on various facets of transfusion Erythropoietin therapy stimulates red cell production while thrombopoietin seems to positively affect megakaryopoiesis and can be an added armamentarium for the thrombocytopenic patient Using haematopoietic growth factors stem cells could be mobilized early to the peripheral blood for collection and subsequent transplantation into haemato oncology patients instead of bone marrow transplantation Using a cocktail of cytokines in cell culture stem cells could be expanded and selected for therapy Cytokines and growth factors can even be modified which may lead to successful gene therapy in malignancies including solid tumour vaccines However the presence of cytokines in certain blood products could have biological effects following transfusion although its clinical relevance needs to be ascertained There is much potential for the use of cytokines in the treatment of infections Early diagnostic methods are now available to monitor their levels and relevance It is likely that cytokines will increasingly play a role in therapy and could develop our fundamental knowledge about the development of T cells An ethical dilemma remains however regarding the use of cytokines in healthy donors for harvesting suitable specific cells Longer clinical observation will be necessary to gather the necessary information Cytokines and growth factors in blood transfusion was the theme of the 21st International Symposium in Blood Transfusion where twenty clinicians and scientists experts in their own fields were invited to update the above information Their findings are presented in four sections in this volume Fundamental aspects cytokines in development of T cells growth factors in haematopoiesis growth factor receptors and signal transduction cytokine response in platelet and whole blood transfusions Function production and diagnosis laboratory diagnostics of cytokines and growth factors cytokines in blood components cytokines and growth factors in cell expansions cytokines for genetic modification towards gene therapy progenitor cells from healthy donors Application in clinical medicine clinical relevance of cytokines in transfusion products cytokines and growth factors in solid tumours gene therapy in malignancies vaccine strategies inducing T cell immunity against tumours cytokines in the treatment of infections thrombopoietin and megakaryopoiesis Future potential use in transfusion medicine erythropoietin immunotherapy ethical aspects of the use of cytokines and growth factors in donors potential of cytokines and growth factors in transfusion medicine

Clinical Applications of Cytokines and Growth Factors John R. Wingard,George D. Demetri,2012-12-06 The hematopoietic system plays roles that are crucial for survival of the host delivery of oxygen to tissues arrest of accidental blood leaking from blood vessels and fending off of invading microbes by humoral cell mediated and phagocytic immunity The activity of the hematopoietic system is staggering

daily a normal adult produces approximately 2.5 billion erythrocytes, 2.5 billion platelets and 1 billion granulocytes per kilogram of body weight. This production is adjusted in a timely fashion to changes in actual needs and can vary from nearly none to many times the normal rate depending on needs which vary from day to day or even minute to minute. In response to a variety of stimuli, the cellular components of the blood are promptly increased or decreased in production to maintain appropriate numbers to optimally protect the host from hypoxia, infection and hemorrhage. How does this all happen and happen without over or under responding? There has been extraordinary growth in our understanding of hematopoiesis over the last two decades. Occupying center stage is the pluripotent stem cell and its progeny. Hematopoietic stem cells have been characterized by their capacity for self renewal and their ability to proliferate and differentiate along multiple lineages. Few in number, the stem cell gives rise to all circulating neutrophils, erythrocytes, lymphoid cells and platelets. In hematopoietic transplantation, the stem cell is capable of restoring long term hematopoiesis in a lethally irradiated host. *Hematopoietic Growth Factors, Oncogenes and Cytokines in Clinical Hematology* E. Cacciola, A. B. Deisseroth, R. Giustolisi, 1994-01-13

Frontiers of Cord Blood Science Niranjana Bhattacharya, Phillip Stubblefield, 2009-04-21 Cord blood is a significant source of hematopoietic stem and progenitor cells for the treatment of blood and genetic disorders. Cord blood is also an alternative to embryos as a source of tissue for regenerative medicine. Cells from cord blood have been shown to transdifferentiate into nonhematopoietic cells including those of the brain, heart, liver, pancreas, bone and cartilage in tissue culture and in animal systems. Recently it has been demonstrated that both cardiac and glial cell differentiation of cord blood donor cells occurred in recipients of unrelated donor cord blood transplantation as part of a treatment regime for Krabbe disease and Sanfilippo syndrome. These observations raise the possibility that cord blood may serve as a source of cells to facilitate tissue repair and regeneration in the future. CD34 stem cell rich umbilical cord whole blood transfusion has the potential to have an immediate benefit of better tissue oxygenation with an additional delayed benefit of possible engraftment of umbilical cord stem cells.
