Circulatory system

- Consists of blood, heart, blood vessels, and lymph
- Circulates blood through two loops (oxygenated and deoxygenated blood)
- Consists of four chambers- two ventricles and two atria
- Possesses a body-wide network of blood vessels: arteries, veins, and capillaries
- Blood vessels transport oxygenated blood and nutrients to all parts of the body, collects metabolic waste to be expelled from the body
- Theoretically, if the veins, arteries, and capillaries of a human were laid out, it would span a distance of 1,000,000 km

Components of the circulatory system:

- Heart
- Muscular organ pumping blood in the body
- Four chambers
- Atria collect blood in the heart
- Ventricles pump it to different organs

Blood vessels

1. Arteries

- Carry blood away from the heart
- Arteries in the systematic loop carry oxygenated blood to different parts of the body
- Arteries in the pulmonary loop carry deoxygenated blood to the lungs

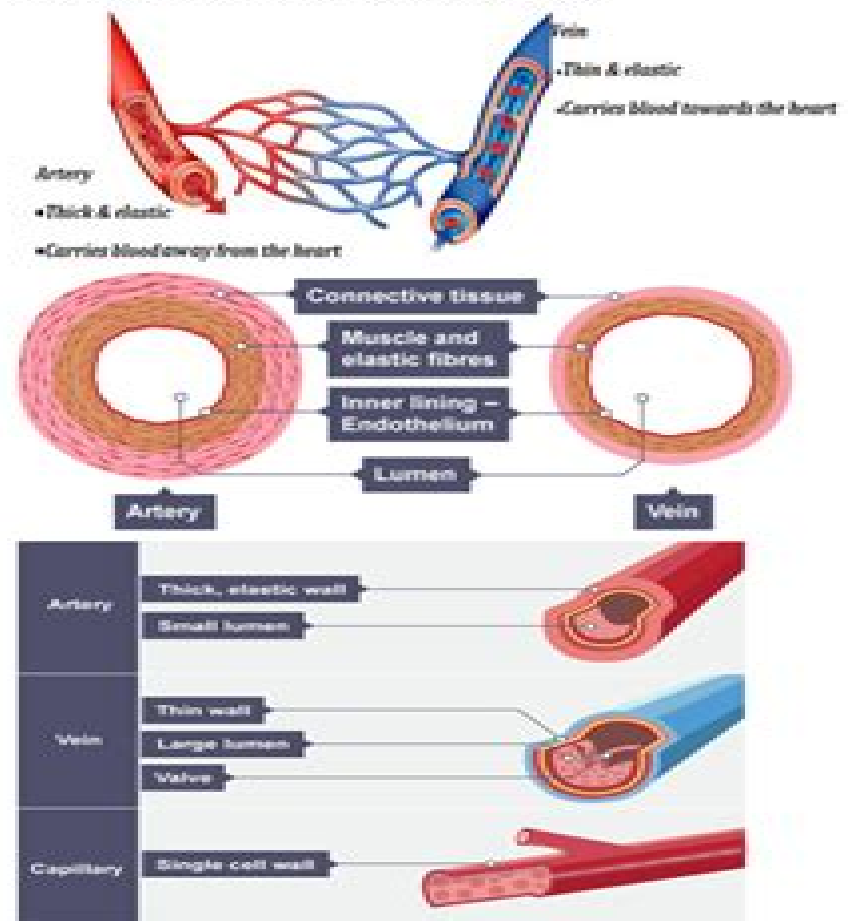

2. Veins

- Carry deoxygenated blood from the body and oxygenated blood from the lungs into the heart

3. Capillaries

- Break down into a minuscule network of capillaries, smallest blood vessels and present in the lungs and muscles
- Connect veins and arteries; molecules are exchanged between the blood and the cells across their walls

Difference between Arteries and Veins

	Artery	Vein	Capillary
Function	Carry blood away from the heart (usually oxygenated blood, except for the pulmonary artery)	Carry blood towards the heart (usually deoxygenated blood, except for the pulmonary vein)	Allows diffusion of gases and nutrients from blood into the body cells
