

3 TYPES OF UNCERTAINTY

1

MODEL UNCERTAINTY

Model uncertainty stems from inter-model and intra-model variability. Inter-model variability is due to each GCM yielding different projections based on their assumptions when provided with the same initial conditions. While intra-model variability is when a single climate model may be provided the same initial information to begin, the complex nature of how the model generates output can lead to one run (set of results) being different from the next.

2

SCENARIO UNCERTAINTY

Models to forecast future climate require estimates of future concentrations of GHGs from human sources. Projecting levels of future GHG emissions requires a set of assumptions about emerging socio-economic circumstances: future changes in population, economic production, energy use, land use and technology. Since these circumstances can change dramatically and unpredictably, GHG-emission scenarios span a large range.

3

INTERNAL VARIABILITY

Internal climate variability (ICV) emerges in response to interactions and feedback among internal components of the climate system. ICV can be observed at the global scale but is most apparent at the regional scale. It matters most in the short term (i.e., weather to seasonal scales), while at longer timescales (decades to centuries), it becomes less relevant as the climate evolves away from the initial conditions.
