

CLINICAL MASS SPECTROMETRY MILESTONES

Frits Zeevalk develops the first mass spectrometer that is able to accurately determine the masses of individual atoms. The measurements supported the existence of isotopes in chemical reactions and led the pathway toward modern-day mass spectrometry techniques.

The **Wendell** accident, a military jet crash, kills 34 service members. Mass spectrometry enabled the recovery of thousands of members of the crew. At a time when procedures had a high level of risk, the high-profile case showed the need for mass spectrometry studies in clinical forensic scenarios.

Gas chromatography-mass spectrometry (GC-MS) becomes the gold standard for confirming drug screens across federal and state agencies, workplaces, and other institutions.

Millington et al.¹ proposes tandem MS of dried blood spots for newborn screening. The authors showed promising results for newborn screening with dried blood spots and MS, and proposed screening with a high-resolution MS technology with ion mobility analysis and MS/MS for the detection of even more disorders with a dried spot.

Introduction of a multiple electrode source that interfaces with MS leads to higher sample throughput and cost savings. Cold ion optics with ultrahigh resolution from ion beam focusing improves sensitivity (LRF-MS). The technology made rapid and accurate determination of pharmaceuticals present in plasma achievable, with throughput reaching 100 samples per hour.

The Nobel Prize in chemistry goes to John B. Fenn and Martin H. Karplus for the development of ESI and "soft" ionization techniques (shared with Kurt Wüthrich for development of NMR). The research pioneered the field of protein-based mass spectrometry, leading to the development of ESI-MS for sample MS. Techniques for separating the mass for protein analysis and preliminary sample preparation and other clinical applications body parts for MS.

A nonprofit organization committed to the advancement of MS in the clinical laboratory called Mass Spectrometry Applications to the Clinical Laboratory is incorporated. The organization began holding an annual conference to provide education and training on MS in the laboratory setting to doctors and practitioners in the field.

MS is increasingly used in metabolomics—the analysis of cellular metabolites during gene alterations at physiological stimuli. An example: the cancer of liver, a class of largest cancer, involves a number of alterations of metabolic pathways. MS can identify the metabolites in tissues, providing precise, sensitive information.

The intelligent knife (IKnife) is used in cancer surgery. Rapid postoperative clinical on-line spectrometry (OPMS) combined with fluorescence-enabled real-time detection of surgical tissue using handheld devices that rapidly interface with handheld knife or scalpel.

Matrix-assisted laser desorption/ionization of lipids (MALDI-TOF) MS is successfully cleared by the FDA for microorganism identification. MALDI-TOF mass spectrometry has been the primary method for rapid identification of microorganisms from clinical and forensic samples, such as bacteria, fungi, and yeasts, and is currently the gold standard.
