

TIMELINE OF CANCER HISTORY AND MAJOR DISCOVERIES

FIRST RECORD

460 - 370 BC

Hippocrates coined the term "carcinoma", derived from the Greek word for crab, due to the invasive nature of tumors. He believed that an excess of black bile was linked to incurable cancers.

130 - 200 AD

The Greek physician **Claudius Galen** used the Greek word "oncos", meaning swelling, to describe tumors. He provided a deeper understanding of the human body, including the potential spread of cancer to different organs.

1895 / 1898

1895: Wilhelm Röntgen discovered X-rays, leading to their use in cancer diagnosis and treatment.
1898: Marie and Pierre Curie discovered radium and polonium, paving the way for radiation therapy.

1953

James Watson and Francis Crick, along with **Rosalind Franklin** and **Maurice Wilkins**, discovered the double-helix structure of DNA that laid the foundation for understanding genetic inheritance and variation.

1990s

Human Genome Project initiation, an international scientific research project with the goal of determining the human DNA sequence. It provided the foundation for understanding the genetic basis of cancer.

2010

The term "liquid biopsy" was coined to describe the analysis of circulating tumor cells and cell free DNA released from tumors. Liquid biopsy represents a promising advancement in cancer care, potentially improving treatment outcomes.

2020s

Continued advancements in immunotherapy, including CAR T-cell therapy and other cellular therapies, as well as the development of personalized cancer vaccines.

3000 BC

The earliest known written description of a disease, specifically breast cancer, is found in an ancient Egyptian text called the Edwin Smith papyrus.

25 BC - 50 AD

The Roman physician **A. Cornelius Celsus** translated this word into "cancer", the Latin word for crab and provided detailed descriptions of various types of tumors, including breast and liver. He also suggested treatment options for cancer, such as surgery and cauterization.

18th Century

John Hunter studied various types of tumors, observed their growth patterns, local spread, and potential for metastasis through the lymphatic system and bloodstream.

Early 20th Century

Scientists began to recognize that cancers seemed to run in families, suggesting a genetic component.

1911

Peyton Rous discovered the first cancer-causing virus, linking viruses to cancer.

1970s - 1980s

The first identification of oncogenes, such as c-SRC, and tumor suppressor genes, including TP53 and RB1. This discovery has provided crucial insights into the underlying mechanisms of cancer development.

Early 21st Century

The development and advancement of genetic testing allowed for the identification of specific genetic mutations in cancer cells, leading to the discovery of more targeted therapies.

2000s

Targeted therapies including trastuzumab for HER2-positive breast cancer and imatinib for chronic myeloid leukemia developed.

2010s

The rise of immunotherapy, including checkpoint inhibitors like PD-1 and CTLA-4 inhibitors, which use the body's immune system to fight cancer.

Cancer Genetics and Therapeutics Madhumita Roy,Amitava Datta,2019-09-16 The book discusses cancer and the potential use of phytochemicals as cancer therapeutics It begins with the basics of cancer including the definition types etiology and molecular mechanisms involved before discussing the fundamentals of diagnosis treatment and associated problems as well as remedial measures Since cancer is not a single disease and the mechanisms of carcinogenesis are different for different cancers it examines the genes and proteins involved in carcinogenesis and signal transduction pathways for each individual cancer type Further the book reviews the latest research on phytochemicals for cancer treatment highlighting their anti cancer properties sources structure active biomolecules and probable mechanisms of action and describing their biochemical properties in the context of cancer prevention and treatment

Gene Therapy of Cancer Wolfgang Walther,Ulrike Stein,2008-02-01 Since the discovery of the molecular structure of genes and the unveiling of the molecular basis of numerous human diseases scientists have been fascinated with the possibility of treating certain diseases by transducing foreign DNA into the affected cells Initially it was proposed that the foreign DNA could either replace defective nonfunctional genes or code for therapeutic proteins This concept has evolved into the rapidly growing field of gene therapy Even though surgery radiotherapy and chemotherapy are widely available and routinely used for cancer treatment these therapies fail to cure approximately 50 percent of cancer patients Therefore since it is a disease characterized by aberrant gene expression cancer has been a target of gene therapy research since the inception of this treatment modality Numerous cancer gene therapy strategies are currently being investigated including gene replacement therapy the regulation of gene expression to modulate immunological responses to

tumors the direct killing of tumor cells and direct interference with tumor growth In this context gene transfer systems tumor specific expression vectors and novel therapeutic genes have been extensively studied All these strategies aim for the selective destruction of human malignant disease while circumventing the destruction of nonmalignant cells and tissues thereby minimizing toxicity to the patient

Douglas, 2007-11-03 A complete introduction and guide to the latest developments in cancer gene therapy from bench to bedside The authors comprehensively review the anticancer genes and gene delivery methods currently available for cancer gene therapy including the transfer of genetic material into the cancer cells stimulation of the immune system to recognize and eliminate cancer cells and the targeting of the nonmalignant stromal cells that support their growth They also thoroughly examine the advantages and limitations of the different therapies and detail strategies to overcome obstacles to their clinical implementation Topics of special interest include vector targeting techniques the lessons learned to date from clinical trials of cancer gene therapy and the regulatory guidelines for future trials Noninvasive techniques to monitor the extent of gene transfer and disease regression during the course of treatment are also discussed

Gene Therapy of Cancer Edmund C. Lattime, Stanton L. Gerson, 2013-08-28 Gene therapy as a treatment for cancer is at a critical point in its evolution Exciting new developments in gene targeting and vector technology coupled with results from the first generation of preclinical and clinical studies have led to the design and testing of new therapeutic approaches The Third Edition of *Gene Therapy of Cancer* provides crucial updates on the basic and applied sciences of gene therapy It offers a comprehensive assessment of the field including the areas of suicide gene therapy oncogene and suppressor gene targeting immunotherapy drug resistance gene therapy and the genetic modification of stem cells Researchers at all levels of development from basic laboratory investigators to clinical practitioners will find this book to be instructive Cancer gene therapy like cancer therapy in general is evolving rapidly testing new concepts targets and pathways evoking new technologies and passing new regulatory hurdles Its essence however has not changed the hope and challenges of returning altered genes to normal using targeted gene expression to alter the function of both tumor and microenvironment and in some cases normal cells and delivering functionally important genes to specific cell types to increase sensitivity to killing or to protect normal cells from cancer therapies In some instances gene therapy for cancer forms a continuum from gene repair through the use of molecularly modified cells the use of viral and non viral vector based

gene delivery to both tumor and tumor microenvironment the use of viral and gene based vaccines and development of new gene based therapeutics The unique mechanistically chosen vector platforms are at the heart of this technology because they allow for direct and selective cell death and transient to sustained delivery of vaccine molecules or molecules that affect the microenvironment vasculature or the immune response Explains the underlying cancer biology necessary for understanding proposed therapeutic approaches Presents in depth description of targeting systems and treatment strategies Covers the breadth of gene therapy approaches including immunotherapeutic drug resistance oncolytic viruses as well as regulatory perspectives from both the NCI and FDA *Gene Therapy of Cancer* Wolfgang Walther, 2022-06-22 This third edition provides new and updated chapters on gene therapeutic strategies of cancer Chapters guide readers through suicide and oncolytic gene therapy gene replacement and gene suppression therapy vector development and refinement immunogene therapy TCR and CAR engineering tumor vaccination using DNA or RNA vaccines and antitumoral immune stimulation at different levels Written in the format of the highly successful *Methods in Molecular Biology* series each chapter includes an introduction to the topic lists necessary materials and reagents includes tips on troubleshooting and known pitfalls and step by step readily reproducible protocols Authoritative and cutting edge *Gene Therapy of Cancer Methods and Protocols Third Edition* aims to be a useful and practical guide to new researchers and experts looking to expand their knowledge
