Cancer Research At The Leading Edge:

Cancer Research at the Leading Edge Ignatius K. Martakis, 2008 Cancer is a group of different diseases more than 100 characterised by uncontrolled growth and spread of abnormal cells Cancer can arise in many sites and behave differently depending on its organ of origin If a cancer spreads metastasises the new tumour bears the same name as the original primary tumour Significant progress has been made in recent years in the battle against cancer and in understanding its underlying biological mechanisms This research progress has resulted in many experimental treatments and cures This book presents new and important research from around the world *Leading Edge Cancer Research* Glenn V. Sizemore, 2007 Cancer is a group of different diseases over 100 characterised by uncontrolled growth and spread of abnormal cells Cancer can arise in many sites and behave differently depending on its organ of origin If a cancer spreads metastasizes the new tumour bears the same name as the original primary tumour Significant progress has been made in recent years in the battle against cancer and in understanding its underlying biological mechanisms This research progress has resulted in many experimental treatments and cures which establish hope for wide spread cures This book brings together important research from around the world in this frontal field Leading Edge Antioxidants Research Harold V. Panglossi, 2007 In biological systems the normal processes of oxidation plus a minor contribution from ionising radiation produce highly reactive free radicals These can readily react with and damage other molecules In some cases the body uses free radicals to destroy foreign or unwanted objects such as in an infection However in the wrong place the body's own cells may become damaged Should the damage occur to DNA the result could be cancer Antioxidants decrease the damage done to cells by reducing oxidants before they can damage the cell Virtually all studies of mammals have concluded that a restricted calorie diet extends the lifespan of mammals by as much as 100 percent This remarkable finding suggests that food is actually more damaging than smoking As food produces free radicals oxidants when metabolised antioxidant rich diets are thought to stave off the effects of ageing significantly better than diets lacking in antioxidants The reduced levels of free radicals resulting from a reduction in their production by metabolism is thought to be a major cause of the success of caloric restriction in increasing life span Antioxidants consist of a group of vitamins including vit Leading-edge Health Education Issues Lennard V. Sebeki, 2008 This book concentrates on the field of health education which is of prime importance in a rapidly changing world where computers and the internet make the possibilities almost limitless The areas of dynamic impact include education and training of health professionals patients medical and other institutions of other higher learning families of ill people and the public at large It is an invaluable addition to the literature *Cancer Research* United States. Congress. Senate. Committee on Appropriations. Subcommittee on Departments of Labor, Health and Human Services, Education, and Related Agencies, 2010 **Debating Cancer: The Paradox In Cancer Research** Henry H Q Heng, 2015-10-08 Cancer research is at a crossroads Traditionally cancer has been thought of as a disease of gene mutation

where the stepwise accumulation of cancer gene mutations is the key and the identification of common gene mutations has been considered to be essential for diagnosis and treatment Despite extensive research efforts and accumulated knowledge on cancer genes and pathways the clinical benefits of this traditional approach have been limited Recently cancer genome sequencing has revealed an extensive amount of genetic heterogeneity where the long expected common mutation drivers have been difficult if not impossible to identify These realities ultimately challenge the conceptual framework of current cancer biology This book introduces a new concept of genome theory of cancer evolution in an attempt to unify the field Many important and representative but often confusing questions and paradoxes are critically analyzed By comparing gene and genome based theories the hidden flaws of many popular viewpoints are addressed This discussion is intended to initiate a much needed critical re evaluation of current cancer research
