

Climates and Biomes

Lab 61

Background

A biome is defined as a large geographic region that has a particular type of climatic community. Biomes are identified by the characteristic plants that dominate the landscape (such as grasslands) or by physical features and climate (such as deserts or tundra). While you are probably familiar with many of the biomes of the world, you may not know what causes biomes to exist. The kinds of plants and animals that coexist and survive in a particular area are determined by the soil, topography, and climate in that area. Biomes take many years to establish. Keep in mind that their boundaries are not as distinct as we would like to think of them, and actually blend into each other.

Objectives

In this lab you will:

1. Investigate some of the physical processes that determine climate.
2. Graph climate data from different places.
3. Classify climate graphs into general biome categories.
4. Use your graphs to compare various biomes.

Procedures and Observations

PART I LATITUDE AND RADIANT ENERGY

Because the earth is shaped like a sphere, the sun's rays strike the earth at different angles. Look at Figure 1 on the next page. Although the amount of energy striking points A, B, and C is equal, the amount that is absorbed depends on the angle of the sun's rays.

1. Consider the effect that latitude has on radiant energy (heat) absorption.

a. *Why is more radiant energy absorbed at A than at B or C?*

b. *What immediate effect would the amount of radiant energy striking a part of the earth have on that place?*
