Computational Methods In Chemical Engineering With Maple:

Computational Methods in Chemical Engineering with Maple Ralph E. White, Venkat R. Subramanian, 2010-02-06

This book presents Maple solutions to a wide range of problems relevant to chemical engineers and others. Many of these solutions use Maple's symbolic capability to help bridge the gap between analytical and numerical solutions. The readers are strongly encouraged to refer to the references included in the book for a better understanding of the physics involved and for the mathematical analysis. This book was written for a senior undergraduate or a first year graduate student course in chemical engineering. Most of the examples in this book were done in Maple 10. However, the codes should run in the most recent version of Maple. We strongly encourage the readers to use the classic worksheet mws option in Maple as we believe it is more user friendly and robust. In chapter one you will find an introduction to Maple which includes simple basics as a convenience for the reader such as plotting, solving linear and nonlinear equations, Laplace transformations, matrix operations, do loop and while loop. Chapter two presents linear ordinary differential equations in section 1 to include homogeneous and nonhomogeneous ODEs, solving systems of ODEs using the matrix exponential and Laplace transform method. In section two of chapter two, nonlinear ordinary differential equations are presented and include simultaneous series reactions, solving nonlinear ODEs with Maple's dsolve command, stop conditions, differential algebraic equations, and steady state solutions. Chapter three addresses boundary value problems.

Solving Nonlinear Partial Differential Equations with Maple and

Mathematica Inna Shingareva, Carlos Lizárraga-Celaya, 2011-07-24. The emphasis of the book is given in how to construct different types of solutions: exact, approximate, analytical, numerical, graphical, of numerous nonlinear PDEs correctly, easily and quickly. The reader can learn a wide variety of techniques and solve numerous nonlinear PDEs included and many other differential equations, simplifying and transforming the equations and solutions, arbitrary functions and parameters presented in the book. Numerous comparisons and relationships between various types of solutions, different methods and approaches are provided. The results obtained in Maple and Mathematica facilitates a deeper understanding of the subject. Among a big number of CAS, we choose the two systems Maple and Mathematica that are used worldwide by students, research mathematicians, scientists and engineers. As in our previous books, we propose the idea to use in parallel both systems Maple and Mathematica since in many research problems frequently it is required to compare independent results obtained by using different computer algebra systems Maple and or Mathematica at all stages of the solution process. One of the main points related to CAS is based on the implementation of a whole solution method, e.g. starting from an analytical derivation of exact governing equations, constructing discretizations and analytical formulas of a numerical method, performing numerical procedure, obtaining various visualizations and comparing the numerical solution obtained with other types of solutions.
