

BLASTIC METAMORPHISM: metamorphism in sedimentary basins, usually at low pressure. First described by Henry Hillebrand, 1908¹. Very good example showing that illite/muscovite mantling conglomeratic breccias occur in relatively unaltered basement (Piedmont) that post date uplift to become a fault trough basin above unroofed Precambrian granulites. Note extensive leucitization associated with P-T² in granulites (see next section). Identical. Note to west, batholith intrusions, some cross thrust faults mantling batholiths. Batholiths with extensive leucitization associated with post orogenic uplift and spread of volcanics. See next figure of granulites.

It's a fairly standard all-sky survey for gamma-rays in the 100-GeV range, performed using HESS, based on a network of seven air Cherenkov telescopes in the Canary Islands. It's a survey for the gamma-ray background, and a direct measurement of the diffuse emission originates from throughout the universe, produced somewhere between 100-100000 years after the Big Bang. It's just a standard HESS-style survey, except it's monitoring the diffuse emission instead of a particular source. It's a standard procedure, and we expect to find that emission will be found in the background.

These findings are also supported by studies that feature laboratory-based findings on characteristics of different perceived support networks. These studies show that older adults are especially likely to befriend individuals of different genders, types of relationships, and backgrounds, possibly for reasons including safety, logistical concerns, and familiarity with a broader social network. Research conducted by the National PIRL is addressing our understanding of how older Americans are utilizing social networks to enhance resilience to both social and economic stressors.
