Classification and Cognition William K. Estes, 1994-01-06 Based on Estes important Fitts Lectures this volume details a set of psychological concepts and principles that offers a unified interpretation of a wide variety of memory categorization and decision making phenomena These phenomena are explained via two families of models established by the author a storage retrieval model and an adaptive network model Estes considers whether the models are competing or complementary offering cogent and instructive arguments for both perspectives Estes theory is then applied to two large scale series of studies on category learning and recognition providing an integrated understanding of seemingly disparate phenomena This book is the culmination of the author's more than ten years of research in the field and stands as a great achievement by one of this century's eminent psychologists It will be indispensable to a wide variety of behavioral scientists including mathematical and cognitive psychologists

Memory-Based Language Processing Walter Daelemans, Antal van den Bosch, 2005-09-01 Memory based language processing a machine learning and problem solving method for language technology is based on the idea that the direct reuse of examples using analogical reasoning is more suited for solving language processing problems than the application of rules extracted from those examples This book discusses the theory and practice of memory based language processing showing its comparative strengths over alternative methods of language modelling Language is complex with few generalizations many sub regularities and exceptions and the advantage of memory based language processing is that it does not abstract away from this valuable low frequency information By applying the model to a range of benchmark problems the authors show that for linguistic areas ranging from phonology to semantics it produces excellent results They also describe TiMBL a software package for memory based language processing The first comprehensive overview of the approach this book will be invaluable for computational linguists psycholinguists and language engineers

Mathematical Principles of Human Conceptual Behavior Ronaldo Vigo, 2014-10-03 The ability to learn concepts lies at the very core of human cognition enabling us to efficiently classify organize identify and store complex information In view of the basic role that concepts play in our everyday physical and mental lives the fields of cognitive science and psychology face three long standing challenges discovering the laws that govern concept learning and categorization behavior in organisms showing how they inform other areas of cognitive research and describing them with the mathematical systematicity and precision found in the physical sciences In light of these theoretical and methodological shortcomings this volume will introduce a set of general mathematical principles for predicting and explaining conceptual behavior The author's theory is based on seven fundamental constructs of universal science invariance complexity information similarity dissimilarity pattern and representation These constructs are joined by a novel mathematical framework that does not depend on probability theory

and derives key results from conceptual behavior research with other key areas of cognitive research such as pattern perception similarity assessment and contextual choice The result is a unique and systematic unifying foundation for cognitive science in the tradition of classical physics *Critical Systems Analysis and Design* Nandish V. Hanninen,2012 This book introduces a theory of music analysis that one can use to explore aspects of segmentation and associative organization in a wide range of repertoire including Western classical music from the Baroque to the present with potential applications to jazz and popular music and some non Western musics Rather than a methodology the theory provides analysts with precise language and a broad flexible conceptual framework through which they can formulate and investigate questions of interest and develop their own interpretations of individual pieces and passages The theory begins with a basic distinction among three domains of musical experience and discourse about it the sonic psychoacoustic the contextual or associative sparked by varying degrees of repetition and the structural guided by a specific theory of musical structure or syntax invoked by the analyst A comprehensive presentation of the theory with copious musical illustrations is balanced with close analyses of works by Beethoven Debussy Nancarrow Riley Feldman and Morris Dora A Hanninen is professor of music theory at the University of Maryland She received the 2010 Outstanding Publication Award from the Society for Music Theory **Conceptions of Giftedness** Shane N.
