Classifying Science Phenomena Data Theory Method Practice Information Science And Knowledge Management:

Classifying Science Rick Szostak, 2007-11-03 Classification is the essential first step in science The study of science as well as the practice of science will thus benefit from a detailed classification of different types of science In this book science defined broadly to include the social sciences and humanities is first unpacked into its constituent elements the phenomena studied the data used the theories employed the methods applied and the practices of scientists These five elements are then classified in turn Notably the classifications of both theory types and methods allow the key strengths and weaknesses of different theories and methods to be readily discerned and compared Connections across classifications are explored should certain theories or phenomena be investigated only with certain methods What is the proper function and form of scientific paradigms Are certain common errors and biases in scientific practice associated with particular phenomena data theories or methods The classifications point to several ways of improving both specialized and interdisciplinary research and teaching and especially of enhancing communication across communities of scholars The classifications also support a superior system of document classification that would allow searches by theory and method used as well as causal links investigated

Records Classification: Concepts, Principles and Methods Umi Asma' Mokhtar, Zawiyah Mohammad Yusof, 2017-05-19 Records Classification Concepts Principles and Methods Information Systems Context introduces classification an early part of the research lifecycle Classification ensures systematic organization of documents and facilitates information retrieval However classification systems are not prevalent in records management when compared to their use in other information fields This book views classification from the records management RM perspective by adopting a qualitative approach with case studies to gather data by means of interview and document content analysis Current development of information systems do not take into account the concept of classification from a RM perspective Such a model is required because the incorporation of information and communication technology ICT in managing records is inevitable The concept of classification from an RM perspective ought to be extended to the ICT team to enable the development of a RM system not limited to storage and retrieval functions but also with relation to disposal and preservation processes This proposed model introduces function based classification to ensure records are classified in context Gives a step by step functional model for constructing a classification system within an organization Advocates for the importance of practicing classification for records towards competent transparent and democratic organizations Helps organizations build their own classification system thus safeguarding information in a secure and systematic fashion Provides local case studies from Malaysia and puts together a generic globally applicable model

Systematicity Paul Hoyningen-Huene, 2013-05-02 In Systematicity Paul Hoyningen Huene answers the question What is science by proposing that scientific knowledge is primarily distinguished from other forms of knowledge especially everyday knowledge by being more systematic Science is here understood in the broadest possible sense encompassing not only the natural sciences but also mathematics the social sciences and the

humanities The author develops his thesis in nine dimensions in which it is claimed that science is more systematic than other forms of knowledge regarding descriptions explanations predictions the defense of knowledge claims critical discourse epistemic connectedness an ideal of completeness knowledge generation and the representation of knowledge He compares his view with positions on the question held by philosophers from Aristotle to Nicholas Rescher The book concludes with an exploration of some consequences of Hoyningen Huene s view concerning the genesis and dynamics of science the relationship of science and common sense normative implications of the thesis and the demarcation criterion between science and pseudo science *Interdisciplinary Knowledge Organization* Rick Szostak, Claudio Gnoli, María

López-Huertas, 2016-03-24 This book proposes a novel approach to classification discusses its myriad advantages and outlines how such an approach to classification can best be pursued It encourages a collaborative effort toward the detailed development of such a classification This book is motivated by the increased importance of interdisciplinary scholarship in the academy and the widely perceived shortcomings of existing knowledge organization schemes in serving interdisciplinary scholarship It is designed for scholars of classification research knowledge organization the digital environment and interdisciplinarity itself The approach recommended blends a general classification with domain specific classification practices The book reaches a set of very strong conclusions Existing classification systems serve interdisciplinary research and teaching poorly A novel approach to classification grounded in the phenomena studied rather than disciplines would serve interdisciplinary scholarship much better It would also have advantages for disciplinary scholarship The productivity of scholarship would thus be increased This novel approach is entirely feasible Various concerns that might be raised can each be addressed The broad outlines of what a new classification would look like are developed This new approach might serve as a complement to or a substitute for existing classification systems Domain analysis can and should be employed in the pursuit of a general classification This will be particularly important with respect to interdisciplinary domains Though the impetus for this novel approach comes from interdisciplinarity it is also better suited to the needs of the Semantic Web and a digital environment more generally Though the primary focus of the book is on classification systems most chapters also address how the analysis could be extended to thesauri and ontologies The possibility of a universal thesaurus is explored The classification proposed has many of the advantages sought in ontologies for the Semantic Web The book is therefore of interest to scholars working in these areas as well **Integrating the Human Sciences** Rick Szostak, 2022-11-15

What if we recognized that the human sciences collectively investigate a few dozen key phenomena that interact with each other Can we imagine a human science that would seek to stitch its understandings of this system of phenomena into a coherent whole If so what would that look like This book argues that we are unlikely to develop one unified theory of everything Our collective understanding must then be a map of the myriad relationships within this large but finite and manageable system coupled with detailed understandings of each causal link and of important subsystems The book outlines such a map and

shows that the pursuit of coherence and a more successful human science enterprise requires integration recognizing the strengths and weaknesses of different methods and theory types and the pursuit of terminological and presentational clarity. It explores how these inter connected goals can be achieved in research teaching library classification public policy and university administration. These suggestions are congruent with and yet enhance other projects for reform of the human sciences. This volume is aimed at any scholar or student who seeks to comprehend how what they study fits within a broader understanding. *American Book Publishing Record*, 2005

Strategies for Team Science Success Kara L. Hall, Amanda L. Vogel, Robert T. Croyle, 2019-11-13 Collaborations that integrate diverse perspectives are critical to addressing many of our complex scientific and societal problems.
