Digital Photoelasticity Advanced Techniques And Applications:

Digital Photoelasticity K. Ramesh, 2012-12-06 Rapid strides have been made in the use of digital image processing techniques for data acquisition in photoelasticity in the last two decades Techniques such as fringe thinning fringe clustering fringe tracing phase shifting polarization stepping and Fourier transform methods have significantly contributed to the automation of data acquisition The recent developments in colour image processing and development of tricolour light source have added a new dimension The use of time delay and integration TDI camera techniques has extended digital photoelasticity for dynamic analysis Now the field of Digital Photoelasticity has matured to a level where it could be used to solve problems in industries Apart from developments in data acquisition techniques several methods have also come into existence for efficient processing of experimental data Extensive use of computer graphics has found a unique place in presenting the experimental results in a meaningful way Though there has been significant developments in data processing and data acquisition in the last two decades there is no book available yet to present these developments in a comprehensive way The motivation for this book is based on the experience of teaching the course on Experimental Methods in Stress Analysis at IIT Kanpur for the last 10 years I have always felt a need for introducing Digital Image Processing in an appropriate way which will be useful for an experimentalist *Digital Photoelasticity* K Ramesh, 2002 *Digital Optical Measurement Techniques and Applications* Pramod Rastogi, 2015-05-01 This new resource explains the principles and applications of today's digital optical measurement techniques From start to finish each chapter provides a concise introduction to the concepts and principles of digital optical metrology followed by a detailed presentation of their applications The development of all these topics including their numerous methods principles and applications has been illustrated using a large number of easy to understand figures This book aims to not only help the reader identify the appropriate techniques in function of the measurement requirements but also assess modern digital measurement systems

Computational and Experimental Mechanics of Advanced Materials Vadim V. Silberschmidt, 2009-11-24 Advanced materials play a crucial role in modern engineering applications where they are often exposed to complex loading and environmental conditions In many cases new approaches are needed to characterise these materials and to model their behaviour Such approaches should be calibrated and validated by specific experimental techniques quantifying both microstructural features and respective mechanisms at various length scales The book provides an overview of modern modelling tools and experimental methods that can be

employed to analyse and estimate properties and performance of advanced materials A special feature of the book is the analysis of case studies used to demonstrate the strategies of solving the real life problems in which the microstructure of materials directly affects their response to loading and or environmental conditions The reader will benefit from a detailed analysis of various methods as well as their implementation for dealing with various advanced materials **A Concept for**

Measuring and Evaluating Optical Anisotropy Effects in Tempered Architectural Glass Steffen Dix,2023-09-25

Optical anisotropy effects can occur in building envelopes made of tempered glass The visual effect has been neglected in the evaluation of the building product and increasingly leads to disputes between the parties involved This thesis extends the state of knowledge on the cause and perception of optical anisotropic effects and presents a concept for measuring and evaluating them in flat monolithic tempered architectural glass Initially an overview and description of current photoelastic measurement methods are given and the accuracy of the used measurement setups is verified for the first time The experimental basis for the concept is formed by extensive full field retardation measurements in the laboratory and field studies of the maximum visibility of the anisotropy effects in an outdoor test rig with accompanying polarization measurements of the sky Various glass types geometries and tempering levels are selected based on typically used products and their influence on the resulting retardation image is investigated Determining a correlation of the retardation images with the reflection images of selected test specimens in the outdoor test rig complements the experiments Based on this digital evaluation methods are presented further developed and applied to the measured retardation images From the critical analysis of these results limit values for different anisotropy quality classes are derived and the concept is complemented With the implementation of the evaluation methods and the limit values in commercial anisotropy scanners the quality of each glass pane can be determined directly after tempering in the future By choosing the highest quality class A it will be possible in the future to significantly reduce anisotropy effects in constructions made of tempered glass panes **Optical**
