

TROPICAL CYCLONES

- A Tropical cyclone is a low-pressure cell that develops over warm oceans between the tropics

i. General characteristics of tropical cyclones

- Tropical cyclones are intense low-pressure systems
- They originate in late summer and/or Autumn
- They need Coriolis force to form
- They move westwards 40km- 200km per day, then turn to curve back at (20°-30°) north and south eastwards 500-700 km/day
- The rotation is clockwise in the southern hemisphere and anti-clockwise in the northern hemisphere
- Feeding of air at the surfaces is nearly equal to the air leaving the cyclone system in the upper troposphere
- They are accompanied by heavy rains, storm surges and high winds

Where do tropical cyclones form

- Tropical cyclones occur between 30°N and 30°S
- They do not occur between the equator (0°) and 5° because there is no Coriolis force between 0°-5° North and South. (In other words, tropical cyclones occur anywhere between 5° -30° N and 5° -30° South.
- They usually occur in the eastern parts of countries because warm ocean currents warm the eastern sides of countries
- In different parts of the world, they are known by different names.
