The Difference Electron Nanoscope Werner Lottermoser, 2017-06-26 This book deals with the difference electron nanoscope DEN whose principles have been invented and realised by the book author The DEN is based on a smart combination of diffractometric and spectroscopic data and uses a visualisation of three dimensional difference electron densities in our case stemming from 3d orbitals in order to obtain the key quantity involved the electric field gradient efg However the DEN is no machine as the title of the book might infer It is a computer program running on a fast computer system displaying 3D difference electron hyperareas floating in space and the relevant efg as a wire frame model within the unit cell of the sample involved In this sense it acts on a sub nanometer scale hence the term nanoscope and generates images of uncompered symmetrical and physical evidence and beauty For the first time diffractometry and spectroscopy have been integrated for the common synergetic effects that may contribute to a better understanding of electric and magnetic interactions in a crystal The experimental derivation of the common quantity the efg is not confined to iron containing samples as the use of Mossbauer spectroscopy might infer but can also be determined by nuclear quadrupole resonance that is not confined to special nuclides Hence the DEN can be applied to a huge multitude of scientifically interesting specimens since the main method involved diffractometry in a wide sense has no general limitations at all So it is a rather universal method and the monograph might contribute to a wide distribution of the method in the scientific world Has anyone seen a real orbital before a real orbital distribution in a crystal unit cell together with its efg tensor ellipsoid In this book one can see it
