Leavitt, Oregon Association for Better Hearing, 2002 This book reviews three important criteria for success with digital hearing aids patient characteristics audiologist characteristics and hearing aid design characteristics Comparison of Two Digital Hearing Aids Sara Beth Harnack Knebel, 1997 Objective Differences Between Premium and Mid-level Digital Hearing Aids, 2018 This ongoing study compared premium and mid level hearing aids from major manufacturers on noise reduction and general electroacoustic characteristics The findings of this study will contribute to the scarce independent literature evaluating currently available hearing aid technology Measuring the overall gain reduction in response to a steady state noise can objectively test noise reduction However such a method does not specifically test a hearing aid's ability to

reduce speech in specific narrow frequency bands Hanline Rout 2008 developed a set of stimuli to evaluate multichannel noise reduction algorithms more precisely We used these stimuli to test noise reduction abilities of hearing aids Premium and mid level digital hearing aids from four major manufacturers were obtained and programmed for mild to moderately severe sloping SNHL using the manufacturer s proprietary fitting formula Each hearing aid was programmed for noise reduction ON and OFF with every other feature disabled or minimized Hearing aid programming was verified and each hearing aid was tested twice for reliability Three different bandwidths of steady state noise 1 3 oct 1 oct 2 oct were embedded at six different frequencies 0 5 1 2 and 4 kHz resulting in 12 new stimuli In addition a 30 second steady state speech shaped noise was included to evaluate the attack time and overall gain reduction of each noise reduction algorithm The findings of this study suggest that there is no difference between the noise reduction efficiency of a premium level hearing aid when compared to a mid level instrument at reducing steady state background noise The frequency specific data indicated that there was a significant difference in the noise reduction capabilities of a mid level and premium level hearing instrument when the background noise included both speech and background noise as simulated by the ICRA stimuli ICRA stimuli was created by the International Collegium for Rehabilitative Audiology for the purpose of analyzing hearing aids as it employs spectra shaped speech like noise Dreschler et al 2001 There was also a significant interaction between technology level and noise bandwidth as well as a significant main effect of noise bandwidth

Subjective Differences Between Premium and Mid-level Digital Hearing Aids, 2019 This study compared perceptual differences between premium and mid level hearing aids from a major manufacturer in normal hearing listeners Limited literature currently exists comparing perceptual differences between premium and mid level digital hearing aids This information is highly important in decision making for clinicians and patients alike Barry et al 2018 evaluated four major hearing aid models noise reduction properties and determined that one manufacturer s premium and mid level devices demonstrated significant differences in noise reduction gain in frequencies associated with human speech We programmed this device for a mild sloping to moderately severe SNHL using the manufacturer s proprietary fitting formula and noise reduction at its maximum setting The hearing aid was mounted on KEMAR and ten Hearing in Noise Test HINT sentences were recorded with each device premium and mid level at two different signal to noise ratios SNR 0 dB SNR and 5 dB SNR Normal hearing listeners n 19 were blindly presented with the pair of stimuli at each signal to noise ratio condition with a three alternative forced choice paradigm whereby they indicate which presentation they preferred or if there was no perceptual differences between the recordings The preferences were made by each subject on the basis of three different criteria noisiness speech intelligibility and overall quality The findings of this study are consistent with previous research and suggest that there is no subjective difference between premium and mid level hearing aids on measures of noisiness speech intelligibility and overall sound quality Overall data suggested that participants did not perceive a statistically significant difference between technology levels for either the 0 dB

SNR condition or the 5 dB SNR condition This suggests that in both very noisy and less noisy environments normal hearing listeners do not perceive any advantage when listening with premium technology Future research should examine premium and mid level technology with objective outcome measures and utilize subjects with hearing loss It may be useful to examine differences between the devices on measures of listening effort as well
