Plasticity Theory and Applications describes the theory of the associated numerical methods for the simulation of a wide range of plastic engineering materials from the simplest infinitesimal plasticity theory to more complex damage mechanics and finite strain crystal plasticity models. It is split into three parts: basic concepts, small strains and large strains. Beginning with elementary theory and progressing to advanced complex theory and computer implementation, it is suitable for use at both introductory and advanced levels. The book offers a self-contained text that allows the reader to learn computational plasticity theory and its implementation from one volume. Includes many numerical examples that illustrate the application of the methodologies described. Provides introductory material on related disciplines and procedures such as tensor analysis, continuum mechanics and finite elements for non-linear solid mechanics. Is accompanied by purpose developed finite element software that illustrates many of the techniques discussed in the text, downloadable from the book's companion website. This comprehensive text will appeal to postgraduate and graduate students of civil, mechanical, aerospace and materials engineering as well as applied mathematics and courses with computational mechanics components. It will also be of interest to research engineers, scientists and software developers working in the field of computational solid mechanics.

Computational Methods in Nonlinear Structural and Solid Mechanics Ahmed K. Noor, Harvey G.

McComb, 2014-05-20. Computational Methods in Nonlinear Structural and Solid Mechanics covers the proceedings of the Symposium on Computational Methods in Nonlinear Structural and Solid Mechanics. The book covers the development of efficient discretization approaches, advanced numerical methods, improved programming techniques and applications of these developments to nonlinear analysis of structures and solids. The chapters of the text are organized into 10 parts according to the issue they tackle. The first part deals with nonlinear mathematical theories and formulation aspects, while the second part covers computational strategies for nonlinear programs. Part 3 deals with time integration and numerical solution of nonlinear algebraic equations, while Part 4 discusses material characterization and nonlinear fracture mechanics, and Part 5 tackles nonlinear interaction problems. The sixth part discusses seismic response and nonlinear analysis of concrete structure, and the seventh part tackles nonlinear problems for nuclear reactors. Part 8 covers crash dynamics and impact problems, while Part 9 deals with nonlinear problems of fibrous composites and advanced nonlinear applications. The last part discusses computerized symbolic manipulation and nonlinear analysis software systems. The book will be of great interest to numerical analysts, computer scientists, structural engineers and other professionals concerned with nonlinear structural and solid mechanics.

Advances in Adaptive Computational Methods in Mechanics P. Ladeveze, J.T. Oden, 1998-06-23. Mastering modelling and in particular numerical models is becoming a crucial and central question in modern computational mechanics. Various tools able to quantify the quality of a model with regard to another one taken as the reference have been derived. Applied to computational strategies, these tools lead to new computational methods which are called adaptive. The present book is concerned with outlining the state of the art and the latest advances in both these important areas. Papers are

selected from a Workshop Cachan 17-19 September 1997 which is the third of a series devoted to Error Estimators and Adaptivity in Computational Mechanics. The Cachan Workshop dealt with latest advances in adaptive computational methods in mechanics and their impacts on solving engineering problems. It was centered too on providing answers to simple questions such as what is being used or can be used at present to solve engineering problems. What should be the state of art in the year 2000? What are the new questions involving error estimators and their applications? **Computational Methods**

in Solid Mechanics A. Curnier, 2012-12-06 This volume presents an introduction to the three numerical methods most commonly used in the mechanical analysis of deformable solids viz the finite element method FEM the linear iteration method LIM and the finite difference method FDM. The book has been written from the point of view of simplicity and unity; its originality lies in the comparable emphasis given to the spatial, temporal and nonlinear dimensions of problem solving. This leads to a neat global algorithm. Chapter 1 addresses the problem of a one dimensional bar with emphasis being given to the virtual work principle. Chapters 2-4 present the three numerical methods. Although the discussion relates to a one dimensional model the formalism used is extendable to two dimensional situations. Chapter 5 is devoted to a detailed discussion of the compact combination of the three methods and contains several sections concerning their computer implementation. Finally Chapter 6 gives a generalization to two and three dimensions of both the mechanical and numerical aspects. For graduate students and researchers whose work involves the theory and application of computational solid mechanics. **Modeling and Computing for Geotechnical Engineering** M.S. Rahman, M.B. Can Ulker, 2018-09-03

Modeling and computing is becoming an essential part of the analysis and design of an engineered system. This is also true of geotechnical systems such as soil foundations, earth dams and other soil structure systems. The general goal of modeling and computing is to predict and understand the behaviour of the system subjected to a variety of possible conditions/scenarios with respect to both external stimuli and system parameters which provides the basis for a rational design of the system. The essence of this is to predict the response of the system to a set of external forces. The modelling and computing essentially involve the following three phases: a) Idealization of the actual physical problem, b) Formulation of a mathematical model represented by a set of equations governing the response of the system, and c) Solution of the governing equations, often requiring numerical methods and graphical representation of the numerical results. This book will introduce these phases. MATLAB codes and MAPLE worksheets are available for those who have bought the book. Please contact the author at mbulker@itu.edu.tr or canulker@gmail.com. Kindly provide the invoice number and date of purchase. **Computational Methods Based on Peridynamics and Nonlocal Operators** Timon Rabczuk, Huilong Ren, Xiaoying Zhuang, 2023-02-15 This book provides an overview of computational methods based on peridynamics and nonlocal operators and their application to challenging numerical problems which are difficult to deal with traditional methods such as the finite element method, material failure being only one of them. The authors have also developed a higher order nonlocal operator approaches.
