

High Mast Light Pole Foundation Design

High Mast Light Pole Foundation Design is generally undertaken in the same manner as any concrete spread or pad foundation. The principle is to make the foundation large enough so that the overturning moment does not exceed the maximum bearing capacity of the soil.

As high mast light poles are standard fixtures they are often designed using standard foundation types which depend on the size of the mast and its location. The High Mast Light Pole Design Spreadsheet includes a unique High Mast Light Pole Foundation Design Spreadsheet which allows the user to specify a suitable high mast lighting foundation in seconds, from one of three typical high mast foundation design types.

The overturning moment depends on the height of the mast, the size and number of lanterns and on the location. This is explained in detail on our High Mast Wind Loading and High Mast Light Pole Wind Pressure pages.

Soil Allowable Maximum Bearing Capacity

High mast pole foundation design is usually based on the assumption that the underlying soil will not fail if the foundation limits the bearing pressure to a set value called the allowable maximum bearing capacity. The maximum bearing capacity of the soil is the pressure at which the soil starts to fail. This is a critical parameter and must be ascertained before detailed high mast lighting foundation design can begin. The bearing capacity of a soil can only be determined from site tests such as plate bearing tests, CPTs or SPTs. This should be undertaken by a suitable qualified civil or geotechnical engineer.

For preliminary design there have been a number of very general guidelines for the design of high mast pole foundations which include standard designs based on one or two assumed values for the allowable maximum bearing pressure. Below is one example taken from the Abacus High Mast lighting foundation design brochure.

These values are only for use in preliminary design and the bearing capacity must be checked with site measurements before detailed design is done. However this does give a handy guide for preliminary high mast light pole foundation design.

Types of subsoil	Condition of subsoil	Field test applicable	Approximate allowance bearing pressure kN/m ²
Rock	Not inferior to sandstone, limestone or firm chalk	Requires at least a pneumatic or other mechanically-operated pick for excavation	1000
Gravel, sand	Compact	Requires pick for excavation. Wooden peg 50mm ² in cross section is hard to drive beyond 150mm	Dense to very dense 150-400 Loose to medium dense 50-250
Clay, sandy clay	Firm	Can be moulded by substantial pressure with the fingers and excavated with graft or spade	50-100
Sand*, silty sand*, clayey sand*	Loose	Can be excavated with a spade. Wooden peg 50mm ² in cross section can be easily driven	<75
Silt*, clay*, sandy clay*, silty clay*	Soft	Fairly easily moulded with the fingers and readily excavated	<75
Silt*, clay*, sandy clay*, silty clay*	Very soft	Natural sample in winter conditions exudes between fingers when squeezed in fist	<75
