Pressure drop in the tank	Air leaks at connections	Let the compressor build pressure in the tank, to get the maximum pressure if possible. Brush soapy water on air connections and look carefully for air bubbles. Tighten leaky connections. If the problem persists, contact Customer Support for further advice.
The solenoid valve leaks when the compressor is idle	Non-return valve seal is defective	Let the air in the tank flow out until all the pressure is released. Then remove the non-return valve plug and clean the valve seal. If necessary, replace the seal and then reinstall all components.
The compressor stopped and does not start	Overload cutout operated because of motor overheating	Check that the main voltage corresponds to specifications. An extension cord that is too thin or too long can cause a voltage drop and cause the motor to overheat. Allow the motor to cool down. Use heavy duty extension cords. Ensure that the compressor is plugged into a socket as close as possible to the consumer unit or fuse box.
	Motor windings are burned out	Contact Customer Support
The motor does not start and makes a humming noise	Capacitor is burned out	Replace starter capacitor
