

6. (a) For every number $k \geq 0$, let f_k be the constant function $f_k(x) = k$. Show that for every k , f_k is computable.
- (b) Let us call an $\mathcal{S}$ program a *straightline program* if it contains no (labeled or unlabeled) instruction of the form IF $V \neq 0$ GOTO L . Show by induction on the length of programs that if the length of a straightline program $\mathcal{P}$ is k , then $\psi_{\mathcal{P}}^{(1)}(x) \leq k$ for all x .
- (c) Show that, if $\mathcal{P}$ is a straightline program that computes f_k , then the length of $\mathcal{P}$ is at least k .
- (d) Show that no straightline $\mathcal{S}$ program computes the function $\text{fact}(x) = x \cdot (x-1) \cdot \dots \cdot 1$. Conclude that the class of functions computable by straightline $\mathcal{S}$ programs is contained in but is not equal to the class of computable functions.
7. Let us call an $\mathcal{S}$ program $\mathcal{P}$ *forwardbranching* if the following condition holds for each occurrence in $\mathcal{P}$ of a labeled or unlabeled instruction of the form IF $V \neq 0$ GOTO L : If IF $V \neq 0$ GOTO L is the i th instruction in $\mathcal{P}$, then either L does not appear as the label of an instruction in $\mathcal{P}$, or else, if j is the least number such that L is the label of the j th instruction in $\mathcal{P}$, then $i < j$. Show that a function is computed by some forwardbranching program if and only if it is computed by some straightline program (see Exercise 6).
8. Let us call a unary function $f(x)$ *partially ω -computable* if it is computed by some $\mathcal{S}$ program $\mathcal{P}$ such that $\mathcal{P}$ has no more than ω instructions, every variable in $\mathcal{P}$ is among $X, Y, Z, \dots, Z_\omega$, and every label in $\mathcal{P}$ is among $A, \dots, A_\omega, B$.
- (a) Show that if a unary function is computed by a program with no more than ω instructions, then it is partially ω -computable.
- (b) Show that for every $n \geq 0$, there are only finitely many distinct partially ω -computable unary functions.
- (c) Show that for every $n \geq 0$, there are only finitely many distinct unary functions computed by $\mathcal{S}$ programs of length no greater than n .
- (d) Conclude that for every $n \geq 0$, there is a partially ω -computable unary function which is not computed by any $\mathcal{S}$ program of length less than n .

9. More about ω -computable

In Section 2 we gave some examples of ω -computable functions (i.e., $\omega \leq n$, $n \geq 0$) giving rise to corresponding sources. Now we consider this process in general.

Computability Complexity And Languages Solution Manual:

An Introduction to Formal Languages and Automata Peter Linz, 2006 Data Structures Theory of Computation

Automata and Computability Ganesh Gopalakrishnan, 2019-03-04 Automata and Computability is a class tested textbook which provides a comprehensive and accessible introduction to the theory of automata and computation. The author uses illustrations, engaging examples, and historical remarks to make the material interesting and relevant for students. It incorporates modern handy ideas such as derivative based parsing and a Lambda reducer showing the universality of Lambda calculus. The book also shows how to sculpt automata by making the regular language conversion pipeline available through a simple command interface. A Jupyter notebook will accompany the book to feature code, YouTube videos, and other supplements to assist instructors and students. Features: Uses illustrations, engaging examples, and historical remarks to make the material accessible. Incorporates modern handy ideas such as derivative based parsing and a Lambda reducer showing the universality of Lambda calculus. Shows how to sculpt automata by making the regular language conversion pipeline available through simple command interface. Uses a mini functional programming FP notation consisting of lambdas, maps, filters, and set comprehension supported in Python to convey math through PL constructs that are succinct and resemble math. Provides all concepts encoded in a compact Functional Programming code that will tessellate with LaTeX markup and Jupyter widgets in a document that will accompany the books. Students can run code effortlessly. <https://github.com/ganeshutah> Jove git here

Chiswell, 2008-11-14 This book is based on notes for a master's course given at Queen Mary University of London in the 1998-99 session. Such courses in London are quite short and the course consisted essentially of the material in the first three chapters together with a two-hour lecture on connections with group theory. Chapter 5 is a considerably expanded version of this. For the course, the main sources were the books by Hopcroft and Ullman [20] by Cohen [4] and by Epstein et al [7]. Some use was also made of a later book by Hopcroft and Ullman [21]. The ulterior motive in the first three chapters is to give a rigorous proof that various notions of recursively enumerable language are equivalent. Three such notions are considered. These are generated by a type 0 grammar, recognised by a Turing machine, deterministic or not, and defined by means of a Godel numbering having defined recursively enumerable for sets of natural numbers. It is hoped that this has been achieved without too many arguments.

using complicated notation This is a problem with the entire subject and it is important to understand the idea of the proof which is often quite simple Two particular places that are heavy going are the proof at the end of Chapter 1 that a language recognised by a Turing machine is type 0 and the proof in Chapter 2 that a Turing machine computable function is partial recursive

The Nature of Computation Cristopher Moore,Stephan Mertens,2011-08-11 The boundary between physics and computer science has become a hotbed of interdisciplinary collaboration In this book the authors introduce the reader to the fundamental concepts of computational complexity and give in depth explorations of the major interfaces between computer science and physics
