Introduction to Scientific Computing and Data Analysis Mark H. Holmes,2016-05-30 This textbook provides an introduction to numerical computing and its applications in science and engineering The topics covered include those usually found in an introductory course as well as those that arise in data analysis This includes optimization and regression based methods using a singular value decomposition The emphasis is on problem solving and there are numerous exercises throughout the text concerning applications in engineering and science The essential role of the mathematical theory underlying the methods is also considered both for understanding how the method works as well as how the error in the computation depends on the method being used The MATLAB codes used to

produce most of the figures and data tables in the text are available on the author's website and SpringerLink

Numerical Linear Algebra and Matrix Factorizations Tom Lyche, 2020-03-02 After reading this book students should be able to analyze computational problems in linear algebra such as linear systems least squares and eigenvalue problems and to develop their own algorithms for solving them Since these problems can be large and difficult to handle much can be gained by understanding and taking advantage of special structures This in turn requires a good grasp of basic numerical linear algebra and matrix factorizations Factoring a matrix into a product of simpler matrices is a crucial tool in numerical linear algebra because it allows us to tackle complex problems by solving a sequence of easier ones The main characteristics of this book are as follows It is self contained only assuming that readers have completed first year calculus and an introductory course on linear algebra and that they have some experience with solving mathematical problems on a computer The book provides detailed proofs of virtually all results Further its respective parts can be used independently making it suitable for self study The book consists of 15 chapters divided into five thematically oriented parts The chapters are designed for a one week per chapter one semester course To facilitate self study an introductory chapter includes a brief review of linear algebra

Exercises in Numerical Linear Algebra and Matrix Factorizations Tom Lyche, Georg Muntingh, Øyvind Ryan, 2020-11-02 To put the world of linear algebra to advanced use it is not enough to merely understand the theory there is a significant gap between the theory of linear algebra and its myriad expressions in nearly every computational domain To bridge this gap it is essential to process the theory by solving many exercises thus obtaining a firmer grasp of its diverse applications Similarly from a theoretical perspective diving into the literature on advanced linear algebra often reveals more and more topics that are deferred to exercises instead of being treated in the main text As exercises grow more complex and numerous it becomes increasingly important to provide supporting material and guidelines on how to solve them supporting students learning process This book provides precisely this type of supporting material for the textbook Numerical Linear Algebra and Matrix Factorizations published as Vol 22 of Springer's Texts in Computational Science and Engineering series Instead of omitting details or merely providing rough outlines this book offers detailed proofs and connects the solutions to the corresponding results in the textbook For the algorithmic exercises the utmost level of detail is provided in the form of MATLAB implementations Both the textbook and solutions are self contained This book and the textbook are of similar length demonstrating that solutions should not be considered a minor aspect when learning at advanced levels

Rowing Biomechanics and Hydrodynamics Ab Aziz Mohd Yusof, Muhamad Noor Harun, Ardiyansyah Syahrom, 2025-03-29 This book introduces engineering principles into the sport of rowing by the integration of rower biomechanics stroke style and blade hydrodynamics to improve the rowing performance in the sport The book starts with an essential overview of rowing covering its history governing organizations and the stroke phases It looks into the biomechanical and hydrodynamic aspects emphasizing different body segments and stroke styles contributing to rower performance Key performance parameters are

discussed such as peak force stroke rate and hydrodynamic force It also highlights the utilization of dynamic rowing simulators and specialized sensors to collect crucial performance assessment and improvement data By addressing the engineering aspects of the sport the book offers the potential for performance enhancement ultimately benefiting the rowing community and advancing sports science
