Squires,2007 Measurements show that the flow over the Aerospatiale A airfoil experiences a laminar separation in the vicinity of the leading edge region just downstream of the peak negative pressure along the suction side Transition occurs in the separated shear layer with the reattached turbulent boundary layer evolving further along the suction side prior to a subsequent separation near the trailing edge The laminar separation and transition is accounted for using the tripleness approach outlined by Travin 57 The tripleness approach provides a means to accommodate the laminar separation and transition in the separated shear layer in the present calculations represented by an activation of the turbulence model The eddy viscosity upstream of the airfoil is zero non zero values are seeded into the suction side of the airfoil using a boundary layer trip **Shock and vibration computer programs** Barbara Pilkey,1975 **Proceedings of the ASME Fluids Engineering Division** ,2002 **Computer Methods and Advances in Geomechanics** D.
