

**EXPERIMENT NO.1****Title:**

Write & Implement C program for performing Linear Search.

**Concept:**

Searching is the process of finding some particular element in the list. If the element is present in the list, then the process is called successful, and the process returns the location of that element; otherwise, the search is called unsuccessful.

Two popular search methods are Linear Search and Binary Search. So, here we will discuss the popular searching technique, i.e., Linear Search Algorithm. Linear search is also called as sequential search algorithm. It is the simplest searching algorithm. In Linear search, we simply traverse the list completely and match each element of the list with the item whose location is to be found. If the match is found, then the location of the item is returned; otherwise, the algorithm returns NULL.

It is widely used to search an element from the unordered list, i.e., the list in which items are not sorted. The worst-case time complexity of linear search is  $O(n)$ .

**Algorithm:** Step 1 :- START

Step 2 :- Start at the beginning of the list (index 0).

Step 3 :- Compare the current element with the target element.

Step 4 :- If the current element matches the target, return the index of that element.

Step 5 :- If the current element doesn't match, move to the next element in the list & repeat step 3.

Step 6 :- If you reach the end of the list and the target element hasn't been found, return an indication that the element is not in the list.

Step 7 :- Exit.
