Combinatorial Theory Classics In Mathematics:

Combinatorial Theory Martin Aigner, 2012-12-06 This book offers a well organized easy to follow introduction to combinatorial theory with examples notes and exercises a very good introduction to combinatorics This book can warmly be recommended first of all to students interested in combinatorics Publicationes Mathematicae Debrecen *Combinatorial Theory* Marshall Hall, 2011-08-15 Includes proof of van der Waerden's 1926 conjecture on permanents Wilson's theorem on asymptotic existence and other developments in combinatorics since 1967 Also covers coding theory and its important connection with designs problems of enumeration and partition Presents fundamentals in addition to latest advances with illustrative problems at the end of each chapter Enlarged appendixes include a longer list of block designs Combinatorial Group Theory Roger C. Lyndon, Paul E. Schupp, 2001-01-12 From the reviews This book defines the boundaries of the subject now called combinatorial group theory it is a considerable achievement to have concentrated a survey of the subject into 339 pages a valuable and welcome addition to the literature containing many results not previously available in a book It will undoubtedly become a standard reference Mathematical Reviews **Combinatorial Theory** D. Jungnickel, K. Vedder, 2014-01-15 Classic Papers in Combinatorics Ira Gessel, Gian-Carlo Rota, 2010-10-06 This volume surveys the development of combinatorics since 1930 by presenting in chronological order the fundamental results of the subject proved in over five decades of original papers by T van Aardenne Ehrenfest R L Brooks N G de Bruijn G F Clements H H Crapo R P Dilworth J Edmonds P Erdős L R Ford Jr D R Fulkerson D Gale L Geissinger I J Good R L Graham A W Hales P Hall P R Halmos R I Jewett I Kaplansky P W Kasteleyn G Katona D J Kleitman K Leeb B Lindström L Lovász D Lubell C St J A Nash Williams G Pólya R Rado F P Ramsey G C Rota B L Rothschild H J Ryser C Schensted M P Schützenberger R P Stanley G Szekeres W T Tutte H E Vaughan H Whitney **Group Theory, Combinatorics, and Computing** Robert Fitzgerald Morse, Daniela Nikolova-Popova, Sarah Witherspoon, 2014-02-13 This volume contains the proceedings of the International Conference on Group Theory Combinatorics and Computing held from October 3-8 2012 in Boca Raton Florida The papers cover a number of areas in group theory and combinatorics Topics include finite simple groups groups acting on structured sets varieties of algebras classification of groups generated by 3 state automata over a 2 letter alphabet new methods for construction of codes and designs groups with constraints on the derived subgroups of its subgroups graphs related to conjugacy classes in groups and lexicographical configurations Application of computer algebra programs is incorporated in several of the papers This volume includes expository articles on finite coverings of loops semigroups and groups and on the application of algebraic structures in the theory of communications This volume is a valuable resource for researchers and graduate students working in group theory and combinatorics The articles provide excellent examples of the interplay between the two areas Farey Sequences Andrey O. Matveev, 2017-11-07 As a first comprehensive overview on Farey sequences and subsequences this monograph is intended as a reference for anyone looking for specific material or formulas

related to the subject Duality of subsequences and maps between them are discussed and explicit proofs are shown in detail From the Content Basic structural and enumerative properties of Farey sequences Collective decision making Committee methods in pattern recognition Farey duality Farey sequence Fundamental Farey subsequences Monotone bijections between Farey subsequences

Weakly Modular Graphs and Nonpositive Curvature Jérémie Chalopin, Victor Chepoi, Hiroshi Hirai, Damian Osajda, 2021-06-18 This article investigates structural geometrical and topological characterizations and properties of weakly modular graphs and of cell complexes derived from them The unifying themes of our investigation are various nonpositive curvature and local to global properties and characterizations of weakly modular graphs and their subclasses Weakly modular graphs have been introduced as a far reaching common generalization of median graphs and more generally of modular and orientable modular graphs Helly graphs bridged graphs and dual polar graphs occurring under different disguises 1 skeletons collinearity graphs covering graphs domains etc in several seemingly unrelated fields of mathematics Metric graph theory Geometric group theory Incidence geometries and buildings Theoretical computer science and combinatorial optimization We give a local to global characterization of weakly modular graphs and their subclasses in terms of simple connectedness of associated triangle square complexes and specific local combinatorial conditions In particular we revisit characterizations of dual polar graphs by Cameron and by Brouwer Cohen We also show that disk Helly graphs are precisely the clique Helly graphs with simply connected clique complexes With 11 embeddable weakly modular and weakly modular graphs we associate high dimensional cell complexes having several strong topological and geometrical properties contractibility and the CAT 0 property Their cells have a specific structure they are basis polyhedra of even matroids in the first case and orthoscheme complexes of gated dual polar subgraphs in the second case We resolve some open problems concerning subclasses of weakly modular graphs we prove a Brady McCammond conjecture about CAT 0 metric on the orthoscheme

The Geometry of Uncertainty Fabio Cuzzolin, 2020-12-17 The principal aim of this book is to introduce to the widest possible audience an original view of belief calculus and uncertainty theory In this geometric approach to uncertainty uncertainty measures can be seen as points of a suitably complex geometric space and manipulated in that space for example combined or conditioned In the chapters in Part I Theories of Uncertainty the author offers an extensive recapitulation of the state of the art in the mathematics of uncertainty This part of the book contains the most comprehensive summary to date of the whole of belief theory with Chap 4 outlining for the first time and in a logical order all the steps of the reasoning chain associated with modelling uncertainty using belief functions in an attempt to provide a self contained manual for the working scientist In addition the book proposes in Chap 5 what is possibly the most detailed compendium available of all theories of uncertainty Part II The Geometry of Uncertainty is the core of this book as it introduces the author's own geometric approach to uncertainty theory starting with the geometry of belief functions Chap 7 studies the geometry of the space of belief functions or belief space both in terms of a simplex and in terms of its recursive

bundle structure Chap 8 extends the analysis to Dempster's rule of combination introducing the notion of a conditional subspace and outlining a simple geometric construction for Dempster's sum Chap 9 delves into the combinatorial properties of plausibility and commonality functions as equivalent representations of the evidence carried by a belief function then Chap 10 starts extending the applicability of the geometric approach to other uncertainty measures focusing in particular on possibility measures consonant belief functions and the related notion of a consistent belief function The chapters in Part III Geometric Interplays are concerned with the interplay of uncertainty measures of different kinds and the geometry of their relationship with a particular focus on the approximation problem Part IV Geometric Reasoning examines the application of the geometric approach to the various elements of the reasoning chain illustrated in Chap 4 in particular conditioning and decision making Part V concludes the book by outlining a future complete statistical theory of random sets future extensions of the geometric approach and identifying high impact applications to climate change machine learning and artificial intelligence The book is suitable for researchers in artificial intelligence statistics and applied science engaged with theories of uncertainty The book is supported with the most comprehensive bibliography on belief and uncertainty theory

Pattern Recognition on Oriented Matroids Andrey O. Matveev, 2017-09-11 Pattern Recognition on Oriented Matroids covers a range of innovative problems in combinatorics poset and graph theories optimization and number theory that constitute a far reaching extension of the arsenal of committee methods in pattern recognition The groundwork for the modern committee theory was laid in the mid 1960s when it was shown that the familiar notion of solution to a feasible system of linear inequalities has ingenious analogues which can serve as collective solutions to infeasible systems A hierarchy of dialects in the language of mathematics for instance open cones in the context of linear inequality systems regions of hyperplane arrangements and maximal covectors or topes of oriented matroids provides an excellent opportunity to take a fresh look at the infeasible system of homogeneous strict linear inequalities the standard working model for the contradictory two class pattern recognition problem in its geometric setting The universal language of oriented matroid theory considerably simplifies a structural and enumerative analysis of applied aspects of the infeasibility phenomenon The present book is devoted to several selected topics in the emerging theory of pattern recognition on oriented matroids the questions of existence and applicability of matroidal generalizations of committee decision rules and related graph theoretic constructions to oriented matroids with very weak restrictions on their structural properties a study in which in particular interesting subsequences of the Farey sequence appear naturally of the hierarchy of the corresponding tope committees a description of the three tope committees that are the most attractive approximation to the notion of solution to an infeasible system of linear constraints an application of convexity in oriented matroids as well as blocker constructions in combinatorial optimization and in poset theory to enumerative problems on tope committees an attempt to clarify how elementary changes one element reorientations in an oriented matroid affect the family of its tope committees a discrete Fourier analysis of the
