Computability And Complexity From A Programming Perspective Foundations Of Computing:

Computability and Complexity Neil D. Jones, 1997 Computability and complexity theory should be of central concern to practitioners as well as theorists Unfortunately however the field is known for its impenetrability Neil Jones's goal as an educator and author is to build a bridge between computability and complexity theory and other areas of computer science especially programming In a shift away from the Turing machine and Godel number oriented classical approaches Jones uses concepts familiar from programming languages to make computability and complexity more accessible to computer scientists and more applicable to practical programming problems According to Jones the fields of computability and complexity theory as well as programming languages and semantics have a great deal to offer each other Computability and complexity theory have a breadth depth and generality not often seen in programming languages The programming language community meanwhile has a firm grasp of algorithm design presentation and implementation In addition programming languages sometimes provide computational models that are more realistic in certain crucial aspects than traditional models New results in the book include a proof that constant time factors do matter for its programming oriented model of computation In contrast Turing machines have a counterintuitive constant speedup property that almost any program can be made to run faster by any amount Its proof involves techniques irrelevant to practice Further results include simple characterizations in programming terms of the central complexity classes PTIME and LOGSPACE and a new approach to complete problems for NLOGSPACE PTIME NPTIME and PSPACE uniformly based on Boolean programs Foundations of Computing series

Reversible Computation: Extending Horizons of Computing Irek Ulidowski, Ivan Lanese, Ulrik Pagh Schultz, Carla Ferreira, 2020-05-13 This open access State of the Art Survey presents the main recent scientific outcomes in the area of reversible computation focusing on those that have emerged during COST Action IC1405 Reversible Computation

Extending Horizons of Computing a European research network that operated from May 2015 to April 2019 Reversible computation is a new paradigm that extends the traditional forwards only mode of computation with the ability to execute in reverse so that computation can run backwards as easily and naturally as forwards It aims to deliver novel computing devices and software and to enhance existing systems by equipping them with reversibility There are many potential applications of reversible computation including languages and software tools for reliable and recovery oriented distributed systems and revolutionary reversible logic gates and circuits but they can only be realized and have lasting effect if conceptual and firm theoretical foundations are established first
