*Topological Obstructions to Stability and Stabilization* Wouter Jongeneel, Emmanuel Moulay, 2023-05-16

This open access book provides a unified overview of topological obstructions to the stability and stabilization of dynamical systems defined on manifolds and an overview that is self contained and accessible to the control oriented graduate student. The authors review the interplay between the topology of an attractor its domain of attraction and the underlying manifold that is supposed to contain these sets. They present some proofs of known results in order to highlight assumptions and to develop extensions and they provide new results showcasing the most effective methods to cope with these obstructions to stability and stabilization. Moreover the book shows how Borsuk's retraction theory and the index theoretic methodology of Krasnoselskii and Zabreiko underlie a large fraction of currently known results. This point of view reveals important open problems and for that reason this book is of interest to any researcher in control dynamical systems topology or related fields.

*Introductory Econometrics with Applications* Ramu Ramanathan, 1998 Offers an ideal combination of econometric theory and hands on practical training for undergraduate and graduate courses. The authors' ambition is to provide realistic applications without sacrificing theoretical underpinnings. He uses a logical step by step approach to walk readers through numerous real world examples of model specification estimation and hypothesis testing. The book also succeeds at being self contained. By including background information on mathematics probability statistics and software applications readers have all the information they need in one place.

Euclidean Distance Geometry Leo Liberti, Carlile Lavor, 2017-09-20 This textbook the first of its kind presents the fundamentals of distance geometry theory useful methodologies for obtaining solutions and real world applications. Concise proofs are given and step by step algorithms for solving fundamental problems efficiently and precisely are presented in Mathematica enabling the reader to experiment with concepts and methods as they are introduced. Descriptive graphics examples and problems accompany the real gems of the text namely the applications in visualization of graphs localization of sensor networks protein conformation from distance data clock synchronization protocols robotics and control of unmanned underwater vehicles to name several. Aimed at intermediate undergraduates beginning graduate students researchers and practitioners the reader with a basic knowledge of linear algebra will gain an understanding of the basic theories of distance geometry and why they work in real life.

*The Valuation Channel of External Adjustment* Mr. Fabio Ghironi, Mr. Jaewoo Lee, Mr. Alessandro Rebucci, 2009-12-01 International financial integration has greatly increased the scope for changes in a country's net foreign asset position through the valuation channel namely capital gains and losses on external assets and liabilities. We examine this valuation channel in a dynamic equilibrium portfolio model with international trade in equity. By separating asset prices and quantities we can characterize the first order dynamics of valuation effects and the current account in macroeconomic dynamics. Specifically we disentangle the roles of excess returns capital gains and portfolio adjustment for consumption risk sharing when financial markets are incomplete.
