Liver Cirrhosis and Its Development J.L. Boyer, 2001-03-31 Liver cirrhosis is a major clinical problem worldwide and is associated with significant morbidity and mortality from its complications such as liver cell insufficiency with coagulopathy and hepatic encephalopathy, portal hypertension with ascites and gastrointestinal bleeding, hepatorenal syndrome, HCC development and others. This volume, the proceedings of Falk Symposium 115 held in Basel, Switzerland, October 22-24, 1999, Part II of the Basel Liver Week 1999, XI International Congress of Liver Diseases, covers our present knowledge of the aetiologies and early stages of liver cirrhosis development. Based on this information, strategies are discussed that are aimed at the prevention, early diagnosis and therapy of chronic liver diseases, thus preventing their progression to cirrhosis and its complications, including HCC development. The main topics mentioned above are complemented by three state-of-the-art chapters on modern aspects of medicine in general and hepatology in particular, as well as their perspectives beyond the year 2000: Molecular Medicine, New Hepatitis Viruses and Genetic Liver Diseases, Diagnosis and Therapy. Introductory chapters focusing on the more basic aspects of the biology of liver cells, as well as on the mechanisms underlying fibrogenesis, cholestasis and inflammation, will be followed by a detailed discussion of the clinically most important causes of liver cirrhosis worldwide: hepatitis viruses B, C and D, toxins, alcohol, drugs and others, as well as metabolic liver diseases: haemochromatosis, Wilson disease, alpha 1 antitrypsin deficiency, porphyria cutanea tarda and protoporphyria. This book therefore will interest clinically oriented basic scientists as well as those in clinical practice, giving an update on many aspects of modern hepatology and its perspectives in the next millennium.

Acute-on-chronic Liver Failure: Systemic Inflammation and Immunosuppression, 2nd edition Yu Shi, Yu-Chen Fan, Jonel Trebicka, Olaf Tyc, Xiaogang Xiang, 2023-08-29 Acute-on-chronic liver failure (ACLF) is a fatal disease that develops on the basis of chronic liver diseases due to acute precipitating events. The lack of definite therapies for ACLF, other than liver transplantation, urges us to investigate its pathophysiological mechanism. It has been recognized that systemic inflammation is a major driver of ACLF. Although the link between systemic inflammation and organ failure has been established, less is known about how systemic inflammation forms and how it impacts on the organ functions. On the other hand, immunosuppression is another facet of immune derangement of ACLF, which leads to secondary bacterial infections and worsens the situation. However, so far we know very little on the development of immunosuppression during ACLF and its molecular mechanisms. Thus, this disease is still a big challenge to both clinicians and researchers. The immune derangement of ACLF is characterized by systemic inflammation and immunosuppression. Therefore, one aspect of this Research Topic is to define the concept of systemic inflammation in the context of ACLF. We should clarify the anatomy of systemic inflammation, including the inducers (DAMP and PAMP), immune cells, cytokines and other elements and their specific roles. We

should also investigate how systemic inflammation impacts on organ function and thereby precipitates the development of organ failure The other aspect of this Research Topic is to delineate immunosuppression in ACLF Likewise we need to define immunosuppression by elucidating its causative mechanisms and uncover the specific stage of ACLF at which immunosuppression occurs Besides it is essential to further evaluate the impact of immunosuppression on the progression of ACLF The investigation at these two facets of immune derangement of ACLF will lead to the discovery of biomarkers and potential therapeutical targets
