Lurie, Paul Enright, 2019-08-02 Classical Feedback Control with Nonlinear Multi Loop Systems describes the design of high performance feedback control systems emphasizing the frequency domain approach widely used in practical engineering It presents design methods for high order nonlinear single and multi loop controllers with efficient analog and digital implementations Bode integrals are employed to estimate the available system performance and to determine the ideal frequency responses that maximize the disturbance rejection and feedback bandwidth Nonlinear dynamic compensators provide global stability and improve transient responses This book serves as a unique text for an advanced course in control system engineering and as a valuable reference for practicing engineers competing in today's industrial environment

Classical Mechanics, Second Edition Tai L. Chow, 2013-05-01 Classical Mechanics Second Edition presents a complete account of the classical mechanics of particles and systems for physics students at the advanced undergraduate level The book evolved from a set of lecture notes for a course on the subject taught by the author at California State University Stanislaus for many years It assumes the reader has been exposed to a course in calculus and a calculus based general physics course However no prior knowledge of differential equations is required Differential equations and new mathematical methods are developed in the text as the occasion demands The book begins by describing fundamental concepts such as velocity and acceleration upon which subsequent chapters build The second edition has been updated with two new sections added to the chapter on Hamiltonian formulations and the chapter on collisions and scattering has been rewritten The book also contains three new chapters covering Newtonian gravity the Hamilton Jacobi theory of dynamics and an introduction to Lagrangian and Hamiltonian formulations for continuous systems and classical fields To help students develop more familiarity with Lagrangian and Hamiltonian formulations these essential methods are introduced relatively early in the text The topics discussed emphasize a modern perspective with special note given to concepts that were instrumental in the development of modern physics for example the relationship between symmetries and the laws of conservation Applications to other branches of physics are also included wherever possible The author provides detailed mathematical manipulations while limiting the inclusion of the more lengthy and tedious ones Each chapter contains homework problems of varying degrees of difficulty to enhance understanding of the material in the text This edition also contains four new appendices on D'Alembert's principle and Lagrange's equations derivation of Hamilton's principle Noether's theorem and conic sections
