C Components And Algorithms:

Algorithms in C, Parts 1-4 Robert Sedgewick, 1997-08-22 Robert Sedgewick has thoroughly rewritten and substantially expanded his popular work to provide current and comprehensive coverage of important algorithms and data structures. Many new algorithms are presented and the explanations of each algorithm are much more detailed than in previous editions. A new text design and detailed innovative figures with accompanying commentary greatly enhance the presentation. The third edition retains the successful blend of theory and practice that has made Sedgewick's work an invaluable resource for more than 250 000 programmers. This particular book, Parts 1-4, represents the essential first half of Sedgewick's complete work. It provides extensive coverage of fundamental data structures and algorithms for sorting, searching, and related applications. The algorithms and data structures are expressed in concise implementations in C so that you can both appreciate their fundamental properties and test them on real applications. Of course, the substance of the book applies to programming in any language.

Highlights: Expanded coverage of arrays, linked lists, strings, trees, and other basic data structures. Greater emphasis on abstract data types (ADTs) than in previous editions. Over 100 algorithms for sorting, selection, priority queue, ADT implementations, and symbol table ADT searching implementations. New implementations of binomial queues, multiway radix sorting, Batcher's sorting networks, randomized BSTs, splay trees, skip lists, multiway tries, and much more. Increased quantitative information about the algorithms, including extensive empirical studies and basic analytic studies, giving you a basis for comparing them. Over 1000 new exercises to help you learn the properties of algorithms. Whether you are a student learning the algorithms for the first time or a professional interested in having up-to-date reference material, you will find a wealth of useful information in this book.

Algorithms in C, Part 5 Robert Sedgewick, 2001-08-16 Once again, Robert Sedgewick provides a current and comprehensive introduction to important algorithms. The focus this time is on graph algorithms, which are increasingly critical for a wide range of applications, such as network connectivity, circuit design, scheduling, transaction processing, and resource allocation. In this book, Sedgewick offers the same successful blend of theory and practice with concise implementations that can be tested on real applications, which has made his work popular with programmers for many years.

Algorithms in C Third Edition Part 5: Graph Algorithms is the second book in Sedgewick's thoroughly revised and rewritten series. The first book, Parts 1-4, addresses fundamental algorithms, data structures, sorting, and searching. A forthcoming third book will focus on strings, geometry, and a range of advanced algorithms. Each book's expanded coverage features new algorithms and implementations, enhanced descriptions and diagrams, and a wealth of new exercises for polishing skills. A focus on abstract data types makes the programs more broadly useful and relevant for the modern object-oriented programming environment. Coverage includes:

- A complete overview of graph properties and types
- Diagraphs and DAGs
- Minimum spanning trees
- Shortest paths
- Network flows

Diagrams, sample C code, and detailed algorithm descriptions. The Web site for this book, <http://www.cs.princeton.edu/rsa>, provides additional source code for programmers along

with numerous support materials for educators A landmark revision Algorithms in C Third Edition Part 5 provides a complete tool set for programmers to implement debug and use graph algorithms across a wide range of computer applications
