Crop Evapotranspiration Guidelines For Computing Water:

Crop Evapotranspiration Food and Agriculture Organization of the United Nations,1998 Equations tables Crop Evapotranspiration Food and Agriculture Organization of the United Nations,1998 Equations tables Methodological guide to reduce carbon and water footprints in banana plantations Food and Agriculture Organization of the United Nations,Deutsche Gesellschaft für Internationale Zusammenarbeit,2018-10-30 The World Banana Forum WBF publication developed a methodological guide to reduce water and carbon footprints in banana plantations worldwide Members of the Working Group WG on Sustainable Production Systems and Environmental Impact acknowledged the contribution of banana production in the total global GHG emissions and the consumption of freshwater in the economic activity both stressed in the 2015 Paris Climate Conference COP21 having the agricultural sector a high mitigation potential Therefore the WG wishes to contribute to the global fight against climate change and promote the sustainable use of natural resources developing practical tools to strengthen the efforts of the global banana industry to reduce its carbon and water footprint CWF Since banana farmers are struggling to adapt to climate change the project aims to mainstream and support the adoption of best climate smart practices and efficient water management in the banana value chain as part of the environmental strategy of organizations Efforts to promote CWF reduction programs in the banana industry are still incipient and carried out mostly by multinationals due in part to the implementation costs the complexity of the topic for farmers the lack of user friendly tools to measure them efficiently and that is still a B2B driven strategy not yet recognized by consumers Even though the need for supporting carbon and water footprint analysis CWF in the banana industry remains strong there is still an apparent lack of sufficient financial incentives by both the governments and the global market **Guidelines and Computer Programs for the Planning and Design of Land Drainage Systems** W. H. van der Molen,J. Martínez Beltrán,Walter J. Ochs,2007-01-01 The aim of this paper is to facilitate the planning and design of land drainage systems for sound land and water management for engineers and other professionals It considers the integration of technical socio economic and environmental factors and the need for system users participation in the planning design operation and maintenance processes The text provides guidelines for the appropriate identification of drainage problems for the planning and design of field drainage systems surface and subsurface and the main drainage and disposal systems The annexes provide more detailed information with technical background appropriate equations some cross references for finding appropriate methodologies and computer programs for calculation of extreme values of permeability and some land drainage system parameters Publisher s description *Turfgrass and Landscape Irrigation Water Quality* Robert Carrow,Ronny R. Duncan,Michael T. Huck,2008-12-17 With the increased use of alternative irrigation water sources on turfgrass and landscape sites their management is becoming more complex and whole ecosystems oriented Yet few turfgrass managers have received formal training in the intricacies of irrigation water *Turfgrass and Landscape Irrigation Water Quality Assessment and Management*

provide *Guidelines for brackish water use for agricultural production in the Near East and North Africa region* Food and Agriculture Organization of the United Nations, Arab Water Council, 2023-01-26 Water scarcity is one of the major challenges in the 19 countries of the Near East and North Africa NENA region The lack of water is affecting important irrigated areas limiting the increase of food production needed to address the growing demand due to population growth In most countries of the NENA region the need to use non conventional water resources including brackish water is well recognized Brackish water is loosely defined as water that is more saline than freshwater but less saline than seawater It covers a large range of salinity levels from 500 to 30 000 mg l of total dissolved solids TDS Despite the presence of large amounts of brackish water and its potential for use in growing a number of crops it is only used in limited amounts for irrigation The successful use of brackish water for irrigation requires a basic understanding of scientific principles affecting the interactions among the climate the applied water the soil the crop and the environment Equally important is the application of suitable technology and management practices that will facilitate the optional use of this poor quality water The successful use of brackish water requires a higher level of management and likely the adoption of new irrigation management practices Because climate water quality soil type and crop tolerance to salinity vary from location to location guidelines with some degree of site specific flexibility must be developed Crop Production Technologies Peeyush Sharma, Vikas Abrol, 2012-01-05 Crop production depends on the successful implementation of the soil water and nutrient management technologies Food production by the year 2020 needs to be increased by 50 percent more than the present levels to satisfy the needs of around 8 billion people Much of the increase would have to come from intensification of agricultural production Importance of wise usage of water nutrient management and tillage in the agricultural sector for sustaining agricultural growth and slowing down environmental degradation calls for urgent attention of researchers planners and policy makers Crop models enable researchers to promptly speculate on the long term consequences of changes in agricultural practices In addition cropping systems under different conditions are making it possible to identify the adaptations required to respond to changes This book adopts an interdisciplinary approach and contributes to this new vision Leading authors analyze topics related to crop production technologies The efforts have been made to keep the language as simple as possible keeping in mind the readers of different language origins The emphasis has been on general descriptions and principles of each topic technical details original research work and modeling aspects However the comprehensive journal references in each area should enable the reader to pursue further studies of special interest The subject has been presented through fifteen chapters to clearly specify different topics for convenience of the readers **Environmental Footprints of Crops** Subramanian Senthilkannan Muthu, 2022-05-26 There are multiple variants of environmental footprints such as carbon footprint ecological footprint water footprint nitrogen footprint and so on There are numerous developments in terms of measuring the environmental footprints of various products Many new indicators are being developed in terms of footprints to measure the environmental

performance of various products The need to measure various environmental footprints of agricultural crops is obvious and does not need any explanation these days when the importance of sustainability is felt so much and being practiced in all industrial sectors including agriculture This book presents five interesting chapters pertaining to environmental footprints of crops
