

The background is a textured, yellowish-brown surface. At the top, there are several diagrams of circles and spheres. Some are dashed lines, some are solid. One circle is labeled S^1 . In the bottom left, there is a diagram of a cylinder-like shape with dashed lines, labeled $S^1 \times S^1$. In the bottom right, there are several horizontal bands with diagonal hatching, some containing dashed lines and small yellow squares.

Differential Topology First Steps Andrew H Wallace:

Differential Topology C. T. C. Wall, 2016-07-04 Exploring the full scope of differential topology this comprehensive account of geometric techniques for studying the topology of smooth manifolds offers a wide perspective on the field Building up from first principles concepts of manifolds are introduced supplemented by thorough appendices giving background on topology and homotopy theory Deep results are then developed from these foundations through in depth treatments of the notions of general position and transversality proper actions of Lie groups handles up to the h cobordism theorem immersions and embeddings concluding with the surgery procedure and cobordism theory Fully illustrated and rigorous in its approach little prior knowledge is assumed and yet growing complexity is instilled throughout This structure gives advanced students and researchers an accessible route into the wide ranging field of differential topology

Differential Topology Andrew H. Wallace, 2012-05-24 Keeping mathematical prerequisites to a minimum this undergraduate level text stimulates students intuitive understanding of topology while avoiding the more difficult subtleties and technicalities Its focus is the method of spherical modifications and the study of critical points of functions on manifolds No previous knowledge of topology is necessary for this text which offers introductory material regarding open and closed sets and continuous maps in the first chapter Succeeding chapters discuss the notions of differentiable manifolds and maps and explore one of the central topics of differential topology the theory of critical points of functions on a differentiable manifold Additional topics include an investigation of level manifolds corresponding to a given function and the concept of spherical modifications The text concludes with applications of previously discussed material to the classification problem of surfaces and guidance along with suggestions for further reading and study

Differential Topology: First Steps Andrew H. Wallace, 1968

Frobenius Algebras and 2-D Topological Quantum Field Theories Joachim Kock, 2004 This 2003 book describes a striking connection between topology and algebra namely that 2D topological quantum field theories are equivalent to commutative Frobenius algebras The precise formulation of the theorem and its proof is given in terms of monoidal categories and the main purpose of the book is to develop these concepts from an elementary level and more generally serve as an introduction to categorical viewpoints in mathematics Rather than just proving the theorem it is shown how the result fits into a more general pattern concerning universal monoidal categories for algebraic structures Throughout the emphasis is on the interplay between algebra and topology with graphical interpretation of algebraic operations and topological structures described algebraically in terms of generators and relations The book will prove valuable to students or researchers entering this field who will learn a host of modern techniques that will prove useful for future work

A Panoramic View of Riemannian Geometry Marcel Berger, 2012-12-06 Riemannian geometry has today become a vast and important subject This new book of Marcel Berger sets out to introduce readers to most of the living topics of the field and convey them quickly to the main results known to date These results are stated without detailed proofs but the main ideas

involved are described and motivated This enables the reader to obtain a sweeping panoramic view of almost the entirety of the field However since a Riemannian manifold is even initially a subtle object appealing to highly non natural concepts the first three chapters devote themselves to introducing the various concepts and tools of Riemannian geometry in the most natural and motivating way following in particular Gauss and Riemann

Lectures on Surfaces A. B. Katok, Vaughn Climenhaga, 2008 Surfaces are among the most common and easily visualized mathematical objects and their study brings into focus fundamental ideas concepts and methods from geometry topology complex analysis Morse theory and group theory At the same time many of those notions appear in a technically simpler and more graphic form than in their general natural settings The first primarily expository chapter introduces many of the principal actors the round sphere flat torus Mobius strip Klein bottle elliptic plane etc as well as various methods of describing surfaces beginning with the traditional representation by equations in three dimensional space proceeding to parametric representation and also introducing the less intuitive but central for our purposes representation as factor spaces It concludes with a preliminary discussion of the metric geometry of surfaces and the associated isometry groups Subsequent chapters introduce fundamental mathematical structures topological combinatorial piecewise linear smooth Riemannian metric and complex in the specific context of surfaces The focal point of the book is the Euler characteristic which appears in many different guises and ties together concepts from combinatorics algebraic topology Morse theory ordinary differential equations and Riemannian geometry The repeated appearance of the Euler characteristic provides both a unifying theme and a powerful illustration of the notion of an invariant in all those theories The assumed background is the standard calculus sequence some linear algebra and rudiments of ODE and real analysis All notions are introduced and discussed and virtually all results proved based on this background This book is a result of the MASS course in geometry in the fall semester of 2007

Computer Graphics and Geometric Modelling Max K. Agoston, 2005-09-05 Possibly the most comprehensive overview of computer graphics as seen in the context of geometric modelling this two volume work covers implementation and theory in a thorough and systematic fashion Computer Graphics and Geometric Modelling Mathematics contains the mathematical background needed for the geometric modeling topics in computer graphics covered in the first volume This volume begins with material from linear algebra and a discussion of the transformations in affine projective geometry followed by topics from advanced calculus chapters on general topology combinatorial topology algebraic topology differential topology differential geometry and finally algebraic geometry Two important goals throughout were to explain the material thoroughly and to make it self contained This volume by itself would make a good mathematics reference book in particular for practitioners in the field of geometric modelling Due to its broad coverage and emphasis on explanation it could be used as a text for introductory mathematics courses on some of the covered topics such as topology general combinatorial algebraic and differential and geometry differential algebraic
