Study Guide: Stoichiometry and Yield Calculations

Stoichiometry is the branch of chemistry that deals with the quantitative relationships between reactants and products in chemical reactions. It's essentially about figuring out how much of each ingredient you need to make a specific amount of "product" in a chemical reaction. To do this, we use balanced chemical equations, which show the mole ratios of reactants and products. These mole ratios are crucial for performing stoichiometric calculations.

Mole Ratios of Chemical Equations

- 1. Definition:** Mole ratios are the proportions of reactants and products in a chemical reaction, represented by the coefficients in a balanced chemical equation.
- 2. Usage:** These ratios allow for the conversion between amounts of different substances in a reaction.
- 3. Example:** For the reaction $2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$, the mole ratio of H_2 to O_2 is 2:1, and the mole ratio of H_2 to H_2O is 1:1.

Stoichiometry

- 1. Definition:** Stoichiometry involves calculating the quantities of reactants and products in chemical reactions based on the balanced equation.
- 2. Steps:**
 1. Write and balance the chemical equation.
 2. Convert quantities of known substances into moles.
 3. Use mole ratios to calculate the moles of the desired substance.
 4. Convert moles back into desired units (grams, liters, etc.).

Predicting Amounts of Reactants with Stoichiometry Calculations

- 1. Identify:** Determine the amount of one reactant given and find the amount of another reactant or product needed.
- 2. Example:** For the reaction $\text{N}_2 + 3\text{H}_2 \rightarrow 2\text{NH}_3$, if you have 5 moles of N_2 , you need $5 \times 3 = 15$ moles of H_2 to fully react.
