Encyclopedia of Geographic Information Science Karen Kemp, 2008 Geographic information science GIScience is an emerging field that combines aspects of many different disciplines Spatial literacy is rapidly becoming recognized as a new essential pier of basic education alongside grammatical logical and mathematical literacy By incorporating location as an essential but often overlooked characteristic of what we seek to understand in the natural and built environment geographic information science GIScience and systems GISystems provide the conceptual foundation and tools to explore this new frontier The Encyclopedia of Geographic Information Science covers the essence of this exciting new and expanding field in an easily understood but richly detailed style In addition to contributions from some of the best recognized scholars in GIScience this volume contains contributions from experts in GIS supporting disciplines who explore how their disciplinary perspectives are expanded within the context of GIScience what changes when consideration of location is added what complexities in analytical procedures are added when we consider objects in 2 3 or even 4 dimensions what can we gain by visualizing our analytical results on a map or 3D display Key Features Brings together GIScience literature that is spread widely across the academic spectrum Offers details about the key foundations of GIScience no matter what their disciplinary origins Elucidates vocabulary that is an amalgam of all of these fields Key Themes Conceptual Foundations Cartography and Visualization Design Aspects Data Manipulation Data Modeling Geocomputation Geospatial Data Societal Issues Spatial Analysis Organizational and Institutional Aspects The Encyclopedia of Geographic Information Science is an important resource for academic and corporate libraries **Map Projections** Erik W. Interacting with Geospatial Technologies Mordechai (Muki)

Haklay, 2015-10-26 This book provides an introduction to HCI and usability aspects of Geographical Information Systems and Science. Its aim is to introduce the principles of Human Computer Interaction (HCI) to discuss the special usability aspects of GIS which designers and developers need to take into account when developing such systems and to offer a set of tried and tested frameworks, matrices and techniques that can be used within GIS projects. Geographical Information Systems and other applications of computerised mapping have gained popularity in recent years. Today computer based maps are common on the World Wide Web, mobile phones, satellite navigation systems and in various desktop computing packages. The more sophisticated packages that allow the manipulation and analysis of geographical information are used in location decisions of new businesses, for public service delivery, for planning decisions by local and central government. Many more applications exist and some estimate the number of people across the world that are using GIS in their daily work at several millions. However many applications of GIS are hard to learn and to master. This is understandable as until quite recently the main focus of software vendors in the area of GIS was on the delivery of basic functionality and development of methods to present and manipulate geographical information using the available computing resources. As a result little attention was paid to usability aspects of GIS. This is evident in many public and private systems where the terminology, conceptual design and structure are all centred around the engineering of GIS and not on the needs and concepts that are familiar to the user. This book covers a range of topics from the cognitive models of geographical representation to interface design. It will provide the reader with frameworks and techniques that can be used and description of case studies in which these techniques have been used for computer mapping application.
