McPherson, Matthew R. Pincus, 2021-06-09 For more than 100 years Henry's Clinical Diagnosis and Management by Laboratory Methods has been recognized as the premier text in clinical laboratory medicine widely used by both clinical pathologists and laboratory technicians. Leading experts in each testing discipline clearly explain procedures and how they are used both to formulate clinical diagnoses and to plan patient medical care and long term management. Employing a multidisciplinary approach it provides cutting edge coverage of automation informatics molecular diagnostics proteomics laboratory management and quality control emphasizing new testing methodologies throughout. Remains the most comprehensive and authoritative text on every aspect of the clinical laboratory and the scientific foundation and clinical application of today's complete range of laboratory tests. Updates include current hot topics and advances in clinical laboratory practices including new and extended applications to diagnosis and management. New content covers next generation mass spectroscopy MS coagulation testing next generation sequencing NGS transfusion medicine genetics and cell free DNA therapeutic antibodies targeted to tumors and new regulations such as ICD 10 coding for billing and reimbursement. Emphasizes the clinical interpretation of laboratory data to assist the clinician in patient management. Organizes chapters by organ system for quick access and highlights information with full color illustrations tables and diagrams. Provides guidance on error detection correction and prevention as well as cost effective test selection. Includes a chapter on Toxicology and Therapeutic Drug Monitoring that discusses the necessity of testing for therapeutic drugs that are more frequently being abused by users. McPherson, 2016-08-31 To interpret the laboratory results To distinguish the normal from the abnormal and to understand the merits and demerits of the assays under study The book attempts to train a laboratory medicine student to achieve sound knowledge of analytical methods and quality control practices to interpret the laboratory results to distinguish the normal from the abnormal and to understand the merits and demerits of the assays under study **Circulating levels and assessment of clinical laboratory analytes, in**

>80-year-old, apparently healthy, moderately healthy, and frail individuals Maria Edvardsson, 2019-09-09 Blood samples are often used to investigate the possible presence of disease and to make treatment decisions. In the interpretation of the results, comparison either with previous values from the same individual or with a set of appropriate group based reference intervals are used. Current reference intervals for common laboratory analytes are often based on measurements from apparently healthy persons aged 18-65 years. Age is accompanied by a general decline in organ functions and it is difficult to determine whether a change in levels of laboratory analytes in an elderly individual can be attributed to age alone, independent of environmental or disease processes. Frailty can be seen as a consequence of age related multifactorial deterioration, physical, cognitive and sensory, resulting in vulnerability and lack of adaptability to internal stressors such as infection or new medication and/or external stressors such as fall at home. Consensus about the definition of frail and frailty is missing both nationally and internationally; the question arises whether different definitions of frailty affect the interpretation of analytes when comparing different groups of elderly. The overarching aim of the thesis was to interpret and assess circulating levels of some clinical laboratory analytes in relation to conventional reference values in 80-year-old apparently healthy, moderately healthy and frail individuals. Data originated from other studies in which blood samples were collected from individuals 80 years old. Comparisons in Paper I of levels of some laboratory analytes from 138 nursing home residents (NHRs) was made with blood from reference populations, both blood donor and the NORIP study. The results indicated differences for some immunological complement factor 3 and 4, immunoglobulin G and M and chemical analytes alanine aminotransferase (ALT), phosphate, albumin, sodium, creatinine and urea, but no differences in levels occurred for aspartate aminotransferase (AST), gamma glutamyltransferase (GT) or lactate dehydrogenase (LDH). It was unclear whether the differences were due to differences in age between the elderly and the reference populations or whether the elderly individuals had chronic diseases and were on medication. In Paper II, 569 individuals 80 years old were classified as healthy, moderately healthy and frail based on diseases, medications and physical and cognitive abilities. Statistical differences between the groups were found for the investigated analytes albumin, ALT, AST, creatinine and GT. In Paper IV, individuals from Paper II (n=569) were divided into two groups and thereafter divided into apparently healthy, moderately healthy and frail. One group was subdivided into apparently healthy, moderately healthy and frail based on physical and cognitive abilities and the other group was divided based on the frailty index (FI). There was no statistical difference found between apparently healthy and moderately healthy groups regardless of classification model used. Among frail individuals, differences in levels occurred for three out of the five investigated analytes (ALT, creatinine and GT) with lower levels occurring when the FI classification model was used. No differences in levels occurred for albumin or AST in frail individuals regardless of classification model used. The aim of Paper III was to study whether 1-year changes in complete blood count (CBC) including haemoglobin (Hb), red blood cell (RBC), erythrocyte volume fraction (EVF), mean corpuscular volume

MCV mean corpuscular Hb concentration MCHC white blood cell WBC and platelet count PLT C reactive protein CRP and interleukin IL 1 IL 1RA IL 6 IL 8 and IL 10 are associated with survival in elderly NHRs aged 80 years Elevated levels of CRP and IL 8 during 1 year follow up were associated with reduced length of survival in elderly NHRs Based on the present thesis it is clear that there is need for reference intervals that consider both age and health status in elderly individuals A reasonable conclusion when interpreting levels of analytes in elderly individuals with disease or frailty is that individual evaluation based on the individual s previous levels is recommended Blodprover anv nds ofta f r att unders ka ev f rekomst av sjukdomar och f r att fatta behandlingsbeslut Vid tolkningen av resultaten anv nds j mf relse antingen med tidigare v rden fr n samma individ eller med en upps ttning l mpliga gruppbaseade referensintervall Nuvarande referensintervall f r vanliga laboratorieanalyser baseras ofta p m tningar fr n tillsynes friska personer i ldern 18 65 r ldern tf ljs av en allm n nedg ng i organfunktioner och det r sv rt att avg ra om en ev f r ndring av niv erna av laboratorieanalyterna kan enbart beror p skillnaden i lder oberoende av milj eller sjukdomsprocesser Sk rhet kan ses som en konsekvens av ldersrelaterad multifaktoriell f rs mring fysisk kognitiv och sensorisk vilket resulterar i s rbarhet och brist p anpassningsf rm ga till interna stressfaktorer som infektion eller ny medicinering och eller yttre stressorer s som att ramla hemma Konsensus om definitionen av sk rhet saknas b de nationellt och internationellt och fr gan uppstod om olika definitioner av sk rhet p verkar tolkningar och referensintervall f r laboratorieanalyter n r man j mf r olika grupper av ldre individer Det vergripande syftet med avhandlingen var att tolka och bed ma cirkulerande niv er f r n gra kliniska laboratorieanalyser i f rh llande till g llande referensv rden hos 80 riga h lsosamma m ttligt friska och sk ra individer Data kommer fr n andra studier inom vilka blodprov samlades alla fr n individer 80 r J mf relser i studie I gjordes mellan blodprover fr n 138 individer i s rskilt boende med blodprover fr n referenspopulationer b de blodgivare och fr n NORIP studien Resultaten visade skillnader f r vissa immunologiska komplementfaktor 3 och 4 och kemiska analyser alaninaminotransferas Alat fosfat albumin natrium kreatinin och urea men inte alla aspartataminotransferas Asat gamma glytamyltransferas GT eller laktatdehydrngas LD Det var oklart om skillnaderna berodde p skillnader i lder mellan de ldre och referenspopulationerna eller om de ldre individerna hade kroniska sjukdomar och medicinerade I studie II klassificerades 569 individer 80 r som h lsosamma m ttligt friska och sk ra baserat p sjukdomar medicinering och fysiska och kognitiva f rm gor Statistiska skillnader mellan grupperna hittades f r de unders kta analyterna albumin Alat Asat kreatinin och y GT I studie IV delades individer fr n papper II n 569 in i tv grupper och delades d refter upp i h lsosamma m ttligt friska och sk ra En grupp delades in i h lsosamma m ttligt friska och sk ra baserat p fysiska och kognitiva f rm gor och den andra gruppen delades in baserat p sk rhetsindex Det fanns ingen statistisk skillnad mellan h lsosamma och m ttligt friska grupperna oavsett vilken klassificeringsmodell som anv ndes Bland sk ra individer intr ffade skillnader i niv er f r tre av de fem unders kta analyterna Alat kreatinin och GT med l gre niv er d r sk rhetsindex hade anv nts som klassificeringsmodell j mf rt klassificering baserad p fysiska och kognitiva f rm gor Syftet med
