

The background of the book cover is a composite image. The top half shows a close-up of turbulent water with white foam. The bottom half shows a ship's hull moving through water, with a grid of points overlaid on the hull, suggesting a computational fluid dynamics (CFD) simulation or a physical model experiment. The entire image is tinted with a blue color scheme.

Continuum Methods Of Physical Modeling Continuum Mechanics Dimensional Analysis Turbulence:

Continuum Methods of Physical Modeling Kolumban Hutter, Klaus Jöhnk, 2004-01-20 The authors give an introduction into continuum thermomechanics the methods of dimensional analysis and turbulence modeling All these themes belong today to the everyday working method of not only environmental physicists but equally also those engineers who are confronted with continuous systems of solid and fluid mechanics soil mechanics and generally the mechanics and thermodynamics of heterogeneous systems Here the reader finds a rigorous mathematical presentation of the material which is also seen as the foundation for environmentally related physics like oceanography limnology glaciology climate dynamics and other topics in geophysics Even though it is hoped that the book will also be used as a source book by researchers in the broad field of continuum physics its intention is essentially to form a basis for teaching for upper level students majoring in mechanics mathematics physics and the classical engineering sciences The intention is to equip the reader with the ability to understand the complex nonlinear modeling in material behaviour and turbulence closure as well as to derive or invent his own models

Principles of Continuum Mechanics Zdeněk Martinec, 2019-05-31 This book addresses the basic concepts of continuum mechanics that is the classical field theory of deformable bodies The theory is systematically developed from the kinematics to the balance equations the material theory and the entropy principles In turn the linear elastic solids the ideal liquid and the Newtonian liquid are presented in detail as concrete applications The book concludes by covering the theory of small motions in a medium with a finite prestress In general the emphasis is on presenting the content in a clear and straightforward way that requires only an elementary grasp of calculus linear algebra and Newtonian mechanics The book is intended for students of physics mechanics engineering and the geosciences as well as applied mathematics with a year or more of college calculus behind them

Lectures Notes on Advanced Structured Materials 2 Holm Altenbach, Leonhard Hitzler, Michael Jöhrlitz, Markus Merkel, Andreas Öchsner, 2024-03-19 The postgraduate seminar series on advanced structured materials is designed to facilitate teaching and informal discussion in a supportive and friendly environment The seminar provides a forum for postgraduate students to present their research results and train their presentation and discussion skills Furthermore it allows for extensive discussion of current research being conducted in the wider area of advanced structured materials Doing so it builds a wider postgraduate community and offers networking opportunities for early career researchers In addition to focused lectures the seminar provides specialized teaching overview lectures from experienced senior academics The 2023 Postgraduate Seminar entitled Advanced Structured Materials Development Manufacturing Characterization Applications was held from 20th till 24th February 2023 in Barcelona The presented postgraduate lectures had a strong focus on polymer mechanics composite materials and additive manufacturing

Advanced Computational Methods and Geomechanics Shenghong Chen, 2023-01-01 The aim of this book is intended through parallel expounding to help readers comprehensively grasp the intrinsic features of typical advanced computational methods These methods are

created in recent three decades for the understanding of the post failure of geo materials accompanied with discontinuous and finite deformation dislocation as well as the violent fluid structure interaction accompanied with strong distortion of water surface The strong points and weak points of the formalisms for governing equations the discretization schemes the nodal interpolation approximation of field variables and their connectivity via support domains covers or enrichments the basic algorithms etc are clarified Being aware of that the differences in these methods are not so large as at the first glance this book will help readers to select appropriate methods to improve the methods for their specific purpose and to evaluate the reliability applicability of the outcomes in the hazard evaluation of geotechnical hydraulic structures beyond extreme work situation This book may be looked at as an advanced continuation of Computational Geomechanics and Hydraulic Structures by the author 2018 Springer Verlag ISBN 978 981 10 8134 7 which elaborates the fundamental computational methods in geomechanics for the routine design of geotechnical hydraulic engineering

Introduction to the Thermodynamically Constrained Averaging Theory for Porous Medium Systems William G. Gray, Cass T. Miller, 2014-02-19 Thermodynamically constrained averaging theory provides a consistent method for upscaling conservation and thermodynamic equations for application in the study of porous medium systems The method provides dynamic equations for phases interfaces and common curves that are closely based on insights from the entropy inequality All larger scale variables in the equations are explicitly defined in terms of their microscale precursors facilitating the determination of important parameters and macroscale state equations based on microscale experimental and computational analysis The method requires that all assumptions that lead to a particular equation form be explicitly indicated a restriction which is useful in ascertaining the range of applicability of a model as well as potential sources of error and opportunities to improve the analysis

Fluid and Thermodynamics Kolumban Hutter, Yongqi Wang, 2016-07-18 In this book fluid mechanics and thermodynamics F T are approached as interwoven not disjoint fields The book starts by analyzing the creeping motion around spheres at rest Stokes flows the Oseen correction and the Lagerstrom Kaplun expansion theories are presented as is the homotopy analysis 3D creeping flows and rapid granular avalanches are treated in the context of the shallow flow approximation and it is demonstrated that uniqueness and stability deliver a natural transition to turbulence modeling at the zero first order closure level The difference quotient turbulence model DQTM closure scheme reveals the importance of the turbulent closure schemes non locality effects Thermodynamics is presented in the form of the first and second laws and irreversibility is expressed in terms of an entropy balance Explicit expressions for constitutive postulates are in conformity with the dissipation inequality Gas dynamics offer a first application of combined F T The book is rounded out by a chapter on dimensional analysis similitude and physical experiments

Computational Geomechanics and Hydraulic Structures Sheng-Hong Chen, 2018-06-21 This book presents recent research into developing and applying computational tools to estimate the performance and safety of hydraulic structures from the planning and construction stage to the service period

Based on the results of a close collaboration between the author and his colleagues friends students and field engineers it shows how to achieve a good correlation between numerical computation and the actual in situ behavior of hydraulic structures The book s heuristic and visualized style disseminates the philosophy and road map as well as the findings of the research The chapters reflect the various aspects of the three typical and practical methods the finite element method the block element method the composite element method that the author has been working on and made essential contributions to since the 1980s This book is an advanced continuation of Hydraulic Structures by the same author published by Springer in 2015 **Non-equilibrium Thermodynamics of Superfluid Helium and Quantum Turbulence** Maria Stella

Mongiovì, David Jou, Michele Sciacca, 2025-07-23 This book puts together non equilibrium thermodynamics heat transport properties of superfluid He II and thermodynamic and dynamic aspects of quantum turbulence A one fluid extended model of superfluid helium with heat flux as an additional independent variable is presented and compared with the two fluid model to explore how both models complement each other Important features arise in rotating situations and in superfluid turbulence characterized by quantized vortices leading to strong nonlinearities between heat flux and temperature gradient The dynamics of vortex lines and their interaction with heat dynamics a central topic in superfluid turbulence is dealt with by introducing the vortex line density as an independent variable and writing its dynamical equations considering the transitions from laminar to turbulent flows and from diffusive to ballistic regimes Classical and quantum turbulence are compared from a mesoscopic view and from their energy spectra The work also explores some parallelisms of quantum vortex thermodynamics with cosmic string thermodynamics and black hole thermodynamics exhibiting duality connections amongst them It emphasizes didactical views over specialistic details and may be used as an introduction to nonequilibrium thermodynamics of superfluid helium and its heat transport properties second sound nonlocal transport nonlinear connections with quantum turbulence The book is useful to researchers in superfluid helium in heat transport and in thermodynamics of cosmic strings and black holes The diversity and complexity of its several physical equations will be inspiring for researchers in mathematical physics **Scientific Computing in Electrical Engineering** Giuseppe

Nicosia, Vittorio Romano, 2020-09-10 This collection of selected papers presented at the 12th International Conference on Scientific Computing in Electrical Engineering SCEE 2018 held in Taormina Sicily Italy in September 2018 showcases the state of the art in SCEE The aim of the SCEE 2018 conference was to bring together scientists from academia and industry mathematicians electrical engineers computer scientists and physicists and to promote intensive discussions on industrially relevant mathematical problems with an emphasis on the modeling and numerical simulation of electronic circuits and of electromagnetic fields This extensive reference work is divided into five parts Computational Electromagnetics Device Modeling and Simulation Circuit Simulation Mathematical and Computational Methods Model Order Reduction Each part starts with a general introduction followed by the respective contributions The book will appeal to mathematicians and

electrical engineers Further it introduces algorithm and program developers to recent advances in the other fields while industry experts will be introduced to new programming tools and mathematical methods Computational Geotechnics
Thomas Nagel,Norbert Böttcher,Uwe-Jens Görke,Olaf Kolditz,2017-04-29 In this book effective computational methods to facilitate those pivotal simulations using open source software are introduced and discussed with a special focus on the coupled thermo mechanical behavior of the rock salt A cohesive coverage of applying geotechnical modeling to the subsurface storage of hydrogen produced from renewable energy sources is accompanied by specific reproducible example simulations to provide the reader with direct access to this fascinating and important field Energy carriers such as natural gas hydrogen oil and even compressed air can be stored in subsurface geological formations such as depleted oil or gas reservoirs aquifers and caverns in salt rock Many challenges have arisen in the design safety and environmental impact assessment of such systems not the least of which is that large scale experimentation is not a feasible option Therefore simulation techniques are central to the design and risk assessment of these and similar geotechnical facilities
