series of tip sheets to help manufacturers optimize their industrial steam systems      *Condensing Economizers for Small Coal-fired Boilers and Furnaces* ,1994 Condensing economizers increase the thermal efficiency of boilers by recovering sensible and latent heat from exhaust gas These economizers are currently being used commercially for this purpose in a wide range of applications Performance is dependent upon application specific factors affecting the utility of recovered heat With the addition of a condensing economizer boiler efficiency improvements up to 10% are possible Condensing economizers can also capture flue gas particulates In this work the potential use of condensing economizers for both efficiency improvement and control of particulate emissions from small coal water slurry fired boilers was evaluated Analysis was done to predict heat transfer and particulate capture by mechanisms including inertial impaction interception diffusion thermophoretic forces and condensation growth Shell and tube geometries were considered with flue gas on the outside of Teflon covered tubes Experimental studies were done with both air and water cooled economizers refit to a small boiler Two experimental arrangements were used including oil firing with injection of flyash upstream of the economizer and direct coal water slurry firing Firing rates ranged from 27 to 82 kW 92 000 to 280 000 Btu hr Inertial impaction was found to be the most important particulate capture mechanism and removal efficiencies to 95% were achieved With the addition of water

sprays directly on the first row of tubes removal efficiencies increased to 98% Use of these sprays adversely affects heat recovery Primary benefits of the sprays are seen to be the addition of small impaction sites and future design improvements are suggested in which such small impactors are permanently added to the highest velocity regions of the economizer Predicted effects of these added impactors on particulate removal and pressure drop are presented

*Condensing Economizers for Efficiency Improvement and Emissions Control in Industrial Boilers* ,1996 Condensing economizers recover sensible and latent heat from boiler flue gas leading to marked improvements in thermal efficiency This paper summarizes the current commercial status and continuing development efforts with one type of condensing economizer In this design Teflon reg\_sign covered tubes and enclosure walls are used to handle the corrosive condensate Flue gas flows around the tubes and feed water being heated flows through the inside In addition to improving thermal efficiency condensing economizers can also be used to reduce particulate emissions primarily by inertial impaction of particles on tube surfaces water droplets and added impactors Collected particles are then removed with condensate Water sprays directly on the tubes can be used to enhance particle capture With coal firing tests have shown particle removal efficiencies as high as 98% To enhance the emissions control potential of condensing economizer technology a two stage economizer system concept has been developed Two heat exchanger modules are used The first is a downflow design and recovers primarily sensible heat from the flue gas The second is upflow and recovers mostly latent heat Condensate is collected in a transition plenum between the two stages This configuration termed the Integrated Flue Gas Treatment System provides great flexibility for implementing emissions reduction strategies Particulate emissions can be reduced without impacting sensible heat recovery by recirculating collected condensate to spray nozzles at the top of the second stage heat exchanger In tests at BNL with heavy oil firing particulate reductions over 90% and final emission rates on the order of 005 lb MMBtu are achieved Adding sorbents to the recirculated condensate reduces sulfur dioxide emissions and SO<sub>2</sub> removal efficiencies over 95% are achieved Also condensing economizers show great potential for the removal of certain air toxics such as mercury and nickel

*Engineering evaluation of the use of the timberline condensing economizer for particulate collection* ,1980

**Condensing Economizers for Small Coal-fired Equipment** ,1994 Condensing economizers can be used to increase the thermal efficiency of boilers and furnaces This study focuses on evaluating indirect contact economizers as applied to heating equipment burning coal water mixtures although the results can be extended to other fuels In addition to dry gas sensible heat latent heat is recovered from flue gas water vapor improving system efficiency markedly In addition to improving thermal efficiency condensing economizers can also capture particulates In tests to date up to 98% total removal has been measured The primary objectives of this project are to evaluate the most important mechanisms involved in particle capture and to enhance capture in practical systems The intent of the work is to contribute to the ongoing program at the Department of Energy Pittsburgh Energy Technology Center in the development of coal fired combustion equipment These

results are expected to be most applicable to smaller scale equipment where the low temperature heat from the economizer can be used. However, interest in the use of condensing economizers for industrial and utility applications is increasing and this work certainly is relevant in these sections also. The approach involves determining thermal efficiency improvement and particulate removal efficiency experimentally and developing models capable of predicting system performance under varied operating conditions. Theoretical gas temperature and condensation profiles through the economizers have been predicted and overall predicted performance are consistent with test results. Mechanisms for particle removal are discussed in this paper and predicted removal efficiencies as a function of particle diameter are presented.

#### **CONDENSING ECONOMIZERS FOR SMALL COAL-FIRED BOILERS AND FURNACES PROJECT REPORT - JANUARY 1994**, 1994

Condensing economizers increase the thermal efficiency of boilers by recovering sensible and latent heat from exhaust gas. These economizers are currently being used commercially for this purpose in a wide range of applications. Performance is dependent upon application specific factors affecting the utility of recovered heat. With the addition of a condensing economizer, boiler efficiency improvements up to 10% are possible. Condensing economizers can also capture flue gas particulates. In this work, the potential use of condensing economizers for both efficiency improvement and control of particulate emissions from small coal water slurry fired boilers was evaluated. Analysis was done to predict heat transfer and particulate capture by mechanisms including inertial impaction, interception, diffusion, thermophoretic forces, and condensation growth. Shell and tube geometries were considered with flue gas on the outside of Teflon covered tubes. Experimental studies were done with both air and water cooled economizers refit to a small boiler. Two experimental arrangements were used including oil firing with injection of flyash upstream of the economizer and direct coal water slurry firing. Firing rates ranged from 27 to 82 kW (92 000 to 280 000 Btu/hr). Inertial impaction was found to be the most important particulate capture mechanism and removal efficiencies to 95% were achieved. With the addition of water sprays directly on the first row of tubes, removal efficiencies increased to 98%. Use of these sprays adversely affects heat recovery. Primary benefits of the sprays are seen to be the addition of small impaction sites and future design improvements are suggested in which such small impacts are permanently added to the highest velocity regions of the economizer. Predicted effects of these added impactors on particulate removal and pressure drop are presented.
