Although there is no friction between block B and the table, there is negligible friction between block A and block B . Initially, the spring is at rest and block B is at the origin of an x - y coordinate system, with the x -axis running along the table. We then pull the block to the right and let it go. As the system undergoes simple harmonic motion with amplitude $x_{\max}$, block A is on the verge of slipping over B . When is slippage most likely?
