Movement Disorders in Neurologic and Systemic Disease Werner Poewe, Joseph Jankovic, 2014-02-20 Movement disorders ranging from parkinsonism to a variety of hyperkinetic disorders such as tremors dystonic chorea and myoclonus can be the presenting or a prominent clinical feature in a broad spectrum of systemic conditions such as endocrine and metabolic disorders autoimmune diseases infections intoxications tumors and paraneoplastic syndromes stroke and multiple sclerosis The resulting clinical scenarios can be confusing and difficult to interpret by internists generalists and neurologists Movement Disorders in Neurologic and Systemic Disease provides comprehensive coverage of the most common movement disorders seen in systemic and general neurologic disease as well as differential diagnostic and therapeutic algorithms The chapters are written by internationally recognized experts and more than 50 illustrative videos highlight the phenomenology of some of the movement disorders and provide a useful bedside diagnostic tool This book is a valuable resource for neurologists physiatrists psychiatrists internists primary care physicians and trainees in medicine and neurology Environmental Health Perspectives, 2009-07 Come as You R(NA): Post-transcriptional Regulation Will Do the Rest Oriane Mauger, Michael A. Kiebler, Clémence Bernard, 2025-08-27 Recent studies have highlighted the discrepancy between transcriptional regulation and protein levels in the brain thus placing post transcriptional mechanisms at the center of neuronal function RNA molecules are highly versatile and regulated at multiple stages of their lifecycle This significantly affects both coding and non coding transcript sequences asymmetric RNA localization in specific compartments RNA stability and resulting protein production We are beginning to understand the many RNA regulatory pathways in progenitors developing and mature neurons and their links with neurological disorders It

all starts in the nucleus with RNA processing regulation intimately coupled with transcription. For instance, alternative processing such as microexon inclusion, cryptic exons, intron retention, or back splicing reactions and resulting circular RNAs impacts the spatio-temporal dynamics of transcripts and amplifies the proteome. In the cytoplasm, an increasing number of pathways are now identified to control translation such as the phase transition of ribonucleoprotein condensates to fine-tune protein production in particular at specific synapses. Advances in omics technologies have massively accelerated our strive to understand the many contributions of post-transcriptional mechanisms in the central nervous system. This has highlighted the specificity of these processes at different developmental stages in different cell and synapse types in response to different stimuli and their substantial alterations in neurodevelopmental and neurodegenerative disorders. Many of these post-transcriptional regulatory steps are well conserved throughout evolution. Others have emerged exclusively in primates, supporting the compelling hypothesis that post-transcriptional mechanisms could play a pivotal role in species evolution. This now paves the way to investigate their functional relevance for neuronal circuits and higher cognitive functions. The revolution of CRISPR and the thorough manipulation of gene sub-sequences without interfering with global gene expression provides a means to directly address the role of post-transcriptional events on neuron development and plasticity. We anticipate that a better understanding of the underlying principles of these mechanisms will provide unprecedented insight into various brain functions. This Research Topic aims to highlight the recent progress on post-transcriptional processes involved in the development, function, and plasticity of brain cells. We welcome Perspective and Review Articles. Themes to be addressed in this Topic include but are not limited to: diverse forms of RNA processing (e.g., alternative splicing, RNA editing, chemical modifications) and their functional relevance; roles of non-coding RNAs (e.g., microRNAs, long non-coding RNAs, circular RNAs); mechanisms of RNA export, transport, and localization; mRNA translational control and its local regulation in specific subcellular compartments; ribonucleoprotein condensates for translational control; technical challenges for single-cell and single-synapse characterization of post-transcriptional programs; post-transcriptional regulation across species.
