

12. Then take the slump-test apparatus and clean it from inside also apply oil to it and to the bottom surface.
13. Then place it on the smooth metallic surface, and fix it firmly.
14. Then put one third of the concrete in the cone and press it with the help of a 5/8 inch, round-ended, tampering rod.
15. It should be tampered 25 times.
16. Then add the second one-third portion of concrete, and also tamper it 25 times with the help of tampering rod.
17. At last add the remaining one-third portion, and also tamper it 25 times.
18. For the upper surface to be smooth work it with float, so that during measurement of slump it is easy to take correct readings.
19. Immediately after filling the cone is slowly lifted, and the unsupported concrete will now slump, hence the name of the test. "The decrease in the height of the centre of the slumped concrete is called slump".

Figure 2: Slump measurement

RESULTS:

The slump test gives the following three results:

- **TRUE-SLUMP:** if the concrete subsides evenly then it is called true-slump, and is aimed to be calculated.
- **SHEAR-SLUMP:** If one half of the cone slides down, it is called shear-slump and is difficult to measure. It occurs in harsh mixes (mixes deficient in fine aggregate).
- **COLLAPSE-SLUMP:** If the concrete slides down as soon as the mould is removed, it is known as collapse-slump. It occurs in very wet mix.
