Co2 Rising The Worlds Greatest Environmental Challenge:

CO2 Rising Tyler Volk, 2010-09-24 An introduction to the global carbon cycle and the human caused disturbances to it that are at the heart of global warming and climate change The most colossal environmental disturbance in human history is under way Ever rising levels of the potent greenhouse gas carbon dioxide CO₂ are altering the cycles of matter and life and interfering with the Earth's natural cooling process Melting Arctic ice and mountain glaciers are just the first relatively mild symptoms of what will result from this disruption of the planetary energy balance In *CO2 Rising* scientist Tyler Volk explains the process at the heart of global warming and climate change the global carbon cycle Vividly and concisely Volk describes what happens when CO₂ is released by the combustion of fossil fuels coal oil and natural gas letting loose carbon atoms once trapped deep underground into the interwoven web of air water and soil To demonstrate how the carbon cycle works Volk traces the paths that carbon atoms take during their global circuits Showing us the carbon cycle from a carbon atom's viewpoint he follows one carbon atom into a leaf of barley and then into an alcohol molecule in a glass of beer through the human bloodstream and then back into the air He also compares the fluxes of carbon brought into the biosphere naturally against those created by the combustion of fossil fuels and explains why the latter are responsible for rising temperatures Knowledge about the global carbon cycle and the huge disturbances that human activity produces in it will equip us to consider the hard questions that Volk raises in the second half of *CO2 Rising* projections of future levels of CO₂ which energy systems and processes solar wind nuclear carbon sequestration will power civilization in the future the relationships among the wealth of nations energy use and CO₂ emissions and global equity in per capita emissions Answering these questions will indeed be our greatest environmental challenge *Environmental Health Perspectives*, 2008, *Paths to a Green World, second edition* Jennifer Clapp, Peter Dauvergne, 2011-03-11 A new edition of a book that takes a comprehensive look at the ways economic processes affect global environmental outcomes This comprehensive and accessible book fills the need for a political economy view of global environmental politics focusing on the ways international economic processes affect environmental outcomes It examines the main actors and forces shaping global environmental management particularly in the developing world Moving beyond the usual emphasis on international agreements and institutions it strives to capture not only academic theoretical debates but also views on politics economics and the environment within the halls of global conferences on the streets during antiglobalization protests and in the boardrooms of international agencies nongovernmental organizations and industry associations The book maps out an original typology of four contrasting worldviews of environmental change those of market liberals institutionalists bioenvironmentalists and social greens and uses them as a framework to examine the links between the global political economy and ecological change This typology provides a common language for students instructors and scholars to discuss the issues across the classical social science divisions The second edition of this popular text has been thoroughly revised and updated to reflect recent events including

the food crisis of 2007 2008 the financial meltdown of 2008 and the Copenhagen Climate Conference of 2009 Topics covered include the environmental implications of globalization wealth poverty and consumption global trade transnational corporations and multilateral and private finance

The Anthropocene Project Byron Williston, 2015 The evidence presented in the recently released Fifth Assessment Report AR5 of the Intergovernmental Panel on Climate Change IPCC suggests strongly that continued failure to make meaningful cuts to greenhouse gas emissions could bring about disastrous results for the human community especially for future generations Summing up the findings of AR5 Rajendra Pachauri chairman of the IPCC has stated that our persistent inaction on climate change presents a grave threat to the very social stability of human systems The Anthropocene Project attempts to make philosophical sense of this examining the reasons for the inaction highlighted by the IPCC and suggests the normative bases for overcoming it Williston identifies that we are now in the human age the Anthropocene but he argues that this is no mere geological marker It is instead best viewed as the latest permutation of an already existing moral and political project rooted in Enlightenment values The author shows that it can be fruitful to do climate ethics with this focus because in so many aspects of our culture we already endorse broadly Enlightenment values about progress equality and the value of knowledge But these values must be robustly instantiated in the dispositions of moral agents and so we require a climate ethics emphasizing the virtues of justice truthfulness and rational hope One of the book's most original claims is that our moral failure on this issue is in large part the product of motivated irrationality on the part of the world's most prosperous people We have failed to live up to our commitments to justice and truthfulness because we are respectively morally weak and self-deceived Understanding this provides the basis for the rational hope that we might yet find a way to avoid climate catastrophe
