Cancer Cell Lines Part 2 Human Cell Culture Volume :

Cancer Cell Lines Part 2 John Masters, Bernhard Ø Palsson, 2006-04-11 Continuous cell lines derived from human cancers are the most widely used resource in laboratory based cancer research. The first 3 volumes of this series on Human Cell Culture are devoted to these cancer cell lines. The chapters in these first 3 volumes have a common aim. Their purpose is to address 3 questions of fundamental importance to the relevance of human cancer cell lines as model systems of each type of cancer: 1 Do the cell lines available accurately represent the clinical presentation? 2 Do the cell lines accurately represent the histopathology of the original tumors? 3 Do the cell lines accurately represent the molecular genetics of this type of cancer? The cancer cell lines available are derived in most cases from the more aggressive and advanced cancers. There are few cell lines derived from low grade organ confined cancers. This gap can be filled with conditionally immortalized human cancer cell lines. We do not know why the success rate for establishing cell lines is so low for some types of cancer and so high for others. The histopathology of the tumor of origin and the extent to which the derived cell line retains the differentiated features of that tumor are critical. The concept that a single cell line derived from a tumor at a particular site is representative of tumors at that site is naive and misleading.

Cancer Cell Lines Bernhard Ø Palsson, John Masters, 2006-04-11 This book describes all human leukemia lymphoma cell lines that have been established and that grow continuously under standardised in vitro conditions. These lines are derived from cells belonging to all the major hematopoietic cell lineages i.e. B and T lymphocytes, natural killer cells, granulocytic cells and megakaryocytic cells. The clinical data, the culture conditions and the major phenotypic features of the cell lines are described with citations. This book is the first book describing human leukemia lymphoma cell lines and will be of interest to scientists involved in the areas of hematology, oncology, immunology, molecular biology and cytogenetics. **Cancer Cell Lines Volumes 1-3** These 3 volumes provide a comprehensive text on the culture of established cell lines from every type of human cancer. The volumes provide a basic manual and reference resource for every cancer research scientist using human cancer cells.

Primary Mesenchymal Cells F. Koller, Bernhard Ø Palsson, John Masters, 2006-04-11 The human body contains many specialized tissues that are capable of fulfilling an incredible variety of functions necessary for our survival. This volume in the Human Cell Culture Series focuses on mesenchymal tissues and cells. The in vitro study of mesenchymal cells is perhaps the oldest form of human cell culture, beginning with the culturing of fibroblasts. Fibroblasts have long been generically described in the literature arising from many tissue types upon in vitro cell culture. However, recent studies, many enabled by new molecular biology techniques, have shown considerable diversity in fibroblast type and function as described within this volume. Mesenchymal tissue types that are described within include bone, cartilage, tendons and ligaments, muscle, adipose tissue and skin dermis. The proper function of these tissues is predominantly dependent upon the proper proliferation, differentiation and function of the mesenchymal cells which make up the tissue. Recent advancements in primary human mesenchymal cell culture have led to remarkable progress in the study of these

tissues Landmark experiments have now demonstrated a stem cell basis for many of these tissues and furthermore significant plasticity and inter conversion of stem cells between these tissues resulting in a great deal of contemporary excitement and controversy Newly developed mesenchymal cell culture techniques have even lead to novel clinical practices for the treatment of disease

Embryonic Stem Cells John R. Masters, Bernhard O. Palsson, James A. Thomson, 2007-05-20 If you wish to grow or characterize embryonic stem cells or persuade them to differentiate into a particular cell type then this book contains information that is vital to your success The aim is to provide clear simple instructions and protocols for growing maintaining and characterizing embryonic stem cells and details of the various methods used to make stem cells differentiate into specific cell types
