

Balancing and Predicting Nuclear Equations Workshop

Information: Nuclear reactions and ionizing radiation

A **nuclear reaction** is a change in the composition of the nucleus of an atom. This is not normally considered a chemical reaction, and does not depend on what molecule the atom might be in.

There are three types of nuclear reactions: fusion, fission, and radioactivity. Fusion (combining of nuclei into larger nuclei, such as in stars and the sun) and fission ("splitting the atom," such as in a nuclear reactor) do not concern us much in chemistry.

Some isotopes are radioactive, meaning that their nuclei break down ("decay") and give off particles, "rays," or both. There is no simple way to predict which isotopes are radioactive.

Table 1: Some types of ionizing radiation produced in nuclear reactions

Type of Radiation	Symbol	Mass Number	Charge	Relative penetrating ability	Shielding required	Biological hazard
Alpha particle	α , ${}^4_2\text{He}$	4	2+	very low	clothing	none unless inhaled
Beta particle	β , ${}^0_{-1}e$	0	1-	low	heavy cloth, plastic	mainly to eyes, skin
Gamma ray	γ , ${}^0_0\gamma$	0	0	very high	lead or concrete	whole body
Neutron	${}_0^1n$	1	0	very high	water, lead	whole body
Positron	β^+ , ${}^0_{+1}e$	0	1+	low	heavy cloth, plastic	mainly to eyes, skin

Balancing Nuclear Equations Practice

- Complete the following nuclear equations in order to balance them. Identify the type of nuclear change represented by the equation.

Type of Nuclear Change

- Write balanced nuclear equations for each process.

a). The alpha decay of radon-198.

b). The beta decay of uranium -237.

Chemistry Nuclear Packet Answers:

Photochemistry Oliver Schalk, Enrico Tapavicza, 2021-03-30 Photochemistry is an important part of both chemistry and biology and is of great practical significance for the development of sustainable sources of energy The mechanisms of photochemistry are far from trivial and far from understood There are limits to how well theory can describe the processes and how well experiments can resolve them This book aims to provide an overview of state of the art methods for both theoretical development and experimental techniques with a focus on ultrafast molecular processes and electronic excitation of organic molecules These fields are active and progress is being made carried by the increasing speed of computation and the development of new light sources most notably X ray sources at large facilities Alongside these two layers of theoretical development and experimental techniques is a third layer model building In this layer model building tries to find similarities in seemingly unrelated experimental results and deepen our general knowledge of photoinduced processes Often progress is made not by cutting edge techniques but rather by using well established techniques with a great variety of molecules this approach promises less glory but is just as important as the first two layers Examples mentioned in the text are the Woodward Hoffman rules and the dynamophore concept All three layers are crucial to push our knowledge further and eventually to use it for developing new and more advanced optical devices
