Computer Vision Models Learning And Inference:

Computer Vision Simon J. D. Prince, 2012-06-18 This modern treatment of computer vision focuses on learning and inference in probabilistic models as a unifying theme It shows how to use training data to learn the relationships between the observed image data and the aspects of the world that we wish to estimate such as the 3D structure or the object class and how to exploit these relationships to make new inferences about the world from new image data With minimal prerequisites the book starts from the basics of probability and model fitting and works up to real examples that the reader can implement and modify to build useful vision systems Primarily meant for advanced undergraduate and graduate students the detailed methodological presentation will also be useful for practitioners of computer vision Covers cutting edge techniques including graph cuts machine learning and multiple view geometry A unified approach shows the common basis for solutions of important computer vision problems such as camera calibration face recognition and object tracking More than 70 algorithms are described in sufficient detail to implement More than 350 full color illustrations amplify the text The treatment is self contained including all of the background mathematics Additional resources at www.computervisionmodels.com

Biologically Inspired Computer Vision Gabriel Cristobal, Laurent Perrinet, Matthias S. Keil, 2015-08-31 As the state of the art imaging technologies became more and more advanced yielding scientific data at unprecedented detail and volume the need to process and interpret all the data has made image processing and computer vision increasingly important Sources of data that have to be routinely dealt with today s applications include video transmission wireless communication automatic fingerprint processing massive databanks non weary and accurate automatic airport screening robust night vision just to name a few Multidisciplinary inputs from other disciplines such as physics computational neuroscience cognitive science mathematics and biology will have a fundamental

impact in the progress of imaging and vision sciences One of the advantages of the study of biological organisms is to devise very different type of computational paradigms by implementing a neural network with a high degree of local connectivity This is a comprehensive and rigorous reference in the area of biologically motivated vision sensors The study of biologically visual systems can be considered as a two way avenue On the one hand biological organisms can provide a source of inspiration for new computational efficient and robust vision models and on the other hand machine vision approaches can provide new insights for understanding biological visual systems Along the different chapters this book covers a wide range of topics from fundamental to more specialized topics including visual analysis based on a computational level hardware implementation and the design of new more advanced vision sensors The last two sections of the book provide an overview of a few representative applications and current state of the art of the research in this area This makes it a valuable book for graduate Master PhD students and also researchers in the field
