CAMSHAFT COVER

The camshaft cover is formed from the same material as the cylinder head, it carries the upper part of the camshaft bearings, the lower half being cast in the cylinder head. The bearings are lubricated, therefore the top half is machined flat.

Camshaft and float: 0.027 to 0.18mm. (0.001 to 0.007in.)

A steel insert in the cast cover runs in a groove machined in the camshaft, to cover the camshaft and float.

The camshaft cover is located with two dowels and retained by four bolts.

To remove the camshaft, turn the engine (SAFE POSITION COMPLETE), then remove the HT distributor cap and arm, the timing belt cover and the rear and side shaft. Slacken the lock washers and remove the camshaft pulley. Remove the rear timing belt and the side plate at the rear of the cast cover. Remove the camshaft cover. The correct sequence is vital, as it is a time to release valve spring tension. Note the position of the timing belt and of the harness clips.

Sealing the cover to the cylinder head is achieved by applying a thin layer of RTV (room temperature vulcanising) sealer along the entire length of the mating surfaces. Do not be adjacent to each bearing provide contact separating onto the bearing surfaces; ensure the old sealer is cleared out before applying the new sealer.
