Degenerate Differential Equations In Banach Spaces Chapman Hallcrc Pure And Applied Mathematics:

Degenerate Differential Equations in Banach Spaces Angelo Favini, Atsushi Yagi, 1998-09-10 This work presents a detailed study of linear abstract degenerate differential equations using both the semigroups generated by multivalued linear operators and extensions of the operational method from Da Prato and Grisvard The authors describe the recent and original results on PDEs and algebraic differential equations and establishes the analyzability of the semigroup generated by some degenerate parabolic operators in spaces of continuous functions Metrical Almost Periodicity and Applications to Integro-Differential Equations Marko Kostić, 2023-06-06 The theory of almost periodic functions is a very active field of research for scholars This research monograph analyzes various classes of multi dimensional metrically almost periodic type functions with values in complex Banach spaces We provide many applications of our theoretical results to the abstract Volterra integro differential inclusions in Banach spaces Almost Periodic and Almost Automorphic Solutions to Integro-Differential Equations Marko Kostić, 2019-05-06 This book discusses almost periodic and almost automorphic solutions to abstract integro differential Volterra equations that are degenerate in time and in particular equations whose solutions are governed by degenerate solution operator families with removable singularities at zero It particularly covers abstract fractional equations and inclusions with multivalued linear operators as well as abstract fractional semilinear Cauchy problems Almost Periodic Type Solutions Marko Kostić, 2025-03-03 Maybe for the first time in the existing literature we investigate here the almost periodic type solutions to the abstract Volterra difference equations depending on several variables We also investigate the generalized almost periodic type sequences and their applications in a rather detailed manner as well as many new important spaces of metrically generalized almost periodic type spaces of sequences and functions We essentially apply some results from the theory of C regularized solution operator families to the abstract Volterra integro differential difference equations contributing also to the theory of fractional calculus and fractional differential equations The theory of abstract Volterra integro differential equations and the theory of abstract Volterra difference equations are very attractive fields of research of many authors The almost periodic features and the asymptotically almost periodic features of solutions to the abstract Volterra differential difference equations in Banach spaces have been sought in many research articles published by now The main aim of this monograph is to continue the work collected in my monographs published with W de Gruyter recently by providing several new results about the existence and uniqueness of almost periodic type solutions to the abstract Volterra integro differential difference equations which could be solvable or unsolvable with respect to the highest derivative order We would like to particularly emphasize that this is probably the first research monograph devoted to the study of almost periodic type solutions to the abstract Volterra difference equations depending on several variables We also consider here many new important spaces of metrically generalized almost periodic type spaces of sequences and functions and their almost automorphic analogues It is also worth

noting that this is probably the first research monograph which concerns the generalized almost periodic type sequences and their applications in a rather detailed manner for the first time in the existing literature we also present here some applications of results from the theory of C regularized solution operator families to the abstract Volterra difference equations Fractional calculus and discrete fractional calculus are rapidly growing fields of theoretical and applied mathematics which are incredibly important in modeling of various real phenomena appearing in different fields like aerodynamics rheology interval valued systems chaotic systems with short memory and image encryption and discrete time recurrent neural networks Many important research results regarding the abstract fractional differential equations and the abstract fractional difference equations in Banach spaces have recently been obtained by a great number of authors from the whole world In this monograph we also contribute to the theories of discrete fractional calculus fractional differential difference equations and multi dimensional Laplace transform Although the monograph is far from being complete we have decided to quote almost eight hundred and fifty research articles which could be of some importance to the interested readers for further developments of the theory established here

Analytic Theory of Itô-Stochastic Differential Equations with Non-smooth Coefficients Haesung Lee, Wilhelm Stannat, Gerald Trutnau, 2022-08-27 This book provides analytic tools to describe local and global behavior of solutions to Itô stochastic differential equations with non degenerate Sobolev diffusion coefficients and locally integrable drift Regularity theory of partial differential equations is applied to construct such solutions and to obtain strong Feller properties irreducibility Krylov type estimates moment inequalities various types of non explosion criteria and long time behavior e g transience recurrence and convergence to stationarity The approach is based on the realization of the transition semigroup associated with the solution of a stochastic differential equation as a strongly continuous semigroup in the L_p space with respect to a weight that plays the role of a sub stationary or stationary density This way we obtain in particular a rigorous functional analytic description of the generator of the solution of a stochastic differential equation and its full domain The existence of such a weight is shown under broad assumptions on the coefficients A remarkable fact is that although the weight may not be unique many important results are independent of it Given such a weight and semigroup one can construct and further analyze in detail a weak solution to the stochastic differential equation combining variational techniques regularity theory for partial differential equations potential and generalized Dirichlet form theory Under classical like or various other criteria for non explosion we obtain as one of our main applications the existence of a pathwise unique and strong solution with an infinite lifetime These results substantially supplement the classical case of locally Lipschitz or monotone coefficients We further treat other types of uniqueness and non uniqueness questions such as uniqueness and non uniqueness of the mentioned weights and uniqueness in law in a certain sense of the solution

Selected Topics in Almost Periodicity Marko Kostić, 2021-11-22 Covers uniformly recurrent solutions and c almost periodic solutions of abstract Volterra integro differential equations as well as various generalizations

of almost periodic functions in Lebesgue spaces with variable coefficients Treats multi dimensional almost periodic type functions and their generalizations in adequate detail *Optimal Control of Complex Structures* K.-H. Hoffmann,Irena Lasiecka,G. Leugering,J. Sprekels,Fredi Tröltzsch,2012-12-06 Interest in the area of control of systems defined by partial differential Equations has increased strongly in recent years A major reason has been the requirement of these systems for sensible continuum mechanical modelling and optimization or control techniques which account for typical physical phenomena Particular examples of problems on which substantial progress has been made are the control and stabilization of mechatronic structures the control of growth of thin films and crystals the control of Laser and semi conductor devices and shape optimization problems for turbomachine blades shells smart materials and microdiffractive optics This volume contains original articles by world reknowned experts in the fields of optimal control of partial differential equations shape optimization numerical methods for partial differential equations and fluid dynamics all of whom have contributed to the analysis and solution of many of the problems discussed The collection provides a state of the art overview of the most challenging and exciting recent developments in the field It is geared towards postgraduate students and researchers dealing with the theoretical and practical aspects of a wide variety of high technology problems in applied mathematics fluid control optimal design and computer modelling Discrete and Continuous Dynamical Systems ,2008 **Stochastic Cauchy Problems in Infinite Dimensions** Irina V. Melnikova,2016-04-27 Stochastic Cauchy Problems in Infinite Dimensions Generalized and Regularized Solutions presents stochastic differential equations for random processes with values in Hilbert spaces Accessible to non specialists the book explores how modern semi group and distribution methods relate to the methods of infinite dimensional stochastic analysis It also shows how the idea of regularization in a broad sense pervades all these methods and is useful for numerical realization and applications of the theory The book presents generalized solutions to the Cauchy problem in its initial form with white noise processes in spaces of distributions It also covers the classical approach to stochastic problems involving the solution of corresponding integral equations The first part of the text gives a self contained introduction to modern semi group and abstract distribution methods for solving the homogeneous deterministic Cauchy problem In the second part the author solves stochastic problems using semi group and distribution methods as well as the methods of infinite dimensional stochastic analysis Discussiones Mathematicae ,2003
