Extending a dynamic programming language and runtime environment with access control Tessenow, Philipp, Felgentreff, Tim, Bracha, Gilad, Hirschfeld, Robert, 2016-11-09 Complexity in software systems is a major factor driving development and maintenance costs To master this complexity software is divided into modules that can be developed and tested separately In order to support this separation of modules each module should provide a clean and concise public interface Therefore the ability to selectively hide functionality using access control is an important feature in a programming language intended for complex software systems Software systems are increasingly distributed adding not only to their inherent complexity but also presenting security challenges The object capability approach addresses these challenges by defining language properties providing only minimal capabilities to objects One programming language that is based on the object capability approach is Newspeak a dynamic programming language designed for modularity and security The Newspeak specification describes access control as one of Newspeak's properties because it is a requirement for the object capability approach However access control as defined in the Newspeak specification is currently not enforced in its implementation This work introduces an access control implementation for Newspeak enabling the security of object capabilities and enhancing modularity We describe our implementation of access control for Newspeak We adapted the runtime environment the reflective system the compiler toolchain and the virtual machine Finally we describe a migration strategy for the existing Newspeak code base so that our access control implementation can be integrated with minimal effort
