Advanced Methods for Knowledge Discovery from Complex Data Ujjwal Maulik, Lawrence B. Holder, Diane J. Cook, 2006-05-06 The growth in the amount of data collected and generated has exploded in recent times with the widespread automation of various day to day activities advances in high level scientific and engineering research and the development of efficient data collection tools This has given rise to the need for automatically analyzing the data in order to extract knowledge from it thereby making the data potentially more useful Knowledge discovery and data mining KDD is the process of identifying valid novel potentially useful and ultimately understandable patterns from massive data repositories It is a multi disciplinary topic drawing from several fields including expert systems machine learning intelligent databases knowledge acquisition case based reasoning pattern recognition and statistics Many data mining systems have typically evolved around well organized database systems e.g relational databases containing relevant information But more and more one finds relevant information hidden in unstructured text and in other complex forms Mining in the domains of the world wide web bioinformatics geoscientific data and spatial and temporal applications comprise some illustrative examples in this regard Discovery of knowledge or potentially useful patterns from such complex data often requires the application of advanced techniques that are better able to exploit the nature and representation of the data Such advanced methods include among others graph based and tree based approaches to relational learning sequence mining link based classification Bayesian networks hidden Markov models neural networks kernel based methods evolutionary algorithms rough sets and fuzzy logic and hybrid systems Many of these methods are developed in the following chapters

Scientific Data Mining and Knowledge Discovery Mohamed Medhat Gaber, 2009-09-19 Mohamed Medhat Gaber It is not my aim to surprise or shock you but the simplest way I can summarise is to say that there are now in the world machines that think that learn and that create Moreover their ability to do these things is going to increase rapidly until in a visible future the range of problems they can handle will be coextensive with the range to which the human mind has been applied by Herbert A Simon 1916 2001 1 Overview This book suits both graduate students and researchers with a focus on discovering knowledge from scientific data The use of computational power for data analysis and knowledge discovery in scientific disciplines has found its roots with the revolution of high performance computing systems Computational science in physics chemistry and biology represents the first step towards automation of data analysis tasks The rationale behind the development of computational science in different areas was automating mathematical operations performed in those areas There was no attention paid to the scientific discovery process Automated Scientific Discovery ASD 1 3 represents the second natural step ASD attempted to automate the process of theory discovery supported by studies in philosophy of science and cognitive sciences Although early research articles have shown great successes the area has not evolved due to many reasons The most important reason was the lack of interaction between scientists and the automating systems
