IUTAM Symposium on Simulation and Identification of Organized Structures in Flows J.N. Sørensen,E.J. Hopfinger,N. Aubry,2012-12-06 The dynamics of transitional and turbulent flows is often dominated by organized structures with a life time much longer than a characteristic time scale of the surrounding small scale turbulence Organized structures may appear as secondary flows as a result of an instability but they persist in turbulent flows They manifest themselves as eddies or localized vortices and play an important role in e g mixing and transport processes Although the existence of organized structures has been revealed by many experiments and by numerical simulations they are somewhat elusive as there is no consensus on how to define them and technically how to detect them In recent years several

identification tools for analysing complex flows have been developed These tools include various versions of the Proper Orthogonal Decomposition POD technique wavelet transforms pattern recognition etc At the same time improvements in experimental techniques have made available data that further necessitate efficient detection methods A prominent example is the Particle Image Velocimetry PIV technique from which complex spatio temporal flow data can be obtained An interesting feature of some of the identification techniques is that they form the basis for reduced models by which dynamical processes can be studied in details From studies of dissipative dynamical systems it has been revealed that in phase space transitional and turbulent flows can be identified by their low dimensional behaviour Thus employing data from experiments or numerical simulations to form modes residing on finite dimensional attractors may dramatically reduce computing costs
