

13-4 Practice Compound Probability

Form G

For Exercises 1–3, determine whether the events are independent or dependent.

1. You roll a 2 on a number cube and spin a 3 on a spinner.
2. You choose a King from a deck of cards and get heads in a coin toss.
3. You roll a number cube and get a 6, and roll again if the first roll is a 6.
4. What is $P(A \text{ and } B)$ if $P(A) = \frac{1}{2}$ and $P(B) = \frac{2}{3}$, where A and B are independent events?
5. What is the probability of rolling a 4 on a fair number cube and getting "tails" when tossing a coin?
6. What is $P(A \text{ or } B)$ if $P(A) = 32\%$ and $P(B) = 17\%$, where A and B are mutually exclusive events?
7. At a local high school, 34% of the students take a bus to school and 26% of the students walk to school. What is the probability of randomly selecting a student that takes a bus or walks to school?
8. What is $P(A \text{ or } B)$ if $P(A) = \frac{1}{4}$ and $P(B) = \frac{1}{2}$, where A and B are overlapping events?
9. A spinner has 8 equal sections numbered 1 to 8. What is the probability of the spinner stopping on a number that is a multiple of 3 or is greater than 5?
10. A local aquarium has 6 turtles, 12 penguins, and 8 sharks. You randomly select 1 animal to watch. What is the probability that you select a turtle or a shark?
11. In a local town, 55% of the residents drive to work, 25% of the residents own a dog, and 6% of the residents walk to work. Find the probability that a randomly chosen resident owns a dog or walks to work.

Use the spinner at the right for Exercises 12–14.

12. What is the probability of the arrow stopping on a consonant or one of the first 4 letters of the alphabet?
13. What is the probability of the arrow stopping on "K" on the first spin and "J" on the second spin?
14. What is the probability of the arrow stopping on "J" or "A" on one spin?

Compound Probability Form G:

The Calculus of Observations Edmund Taylor Whittaker, George Robinson, 1924 The subject matter of the calculus as it is employed in interpolation numerical integration and solution of equations calculating frequency curves deviation periodicities probabilities etc method of least squares graduation of observations correlation etc Point Processes D.R. Cox, Valerie Isham, 2018-12-19 There has been much recent research on the theory of point processes i.e. on random systems consisting of point events occurring in space or time Applications range from emissions from a radioactive source occurrences of accidents or machine breakdowns or of electrical impulses along nerve fibres to repetitive point events in an individual's medical or social history Sometimes the point events occur in space rather than time and the application here ranges from statistical physics to geography The object of this book is to develop the applied mathematics of point processes at a level which will make the ideas accessible both to the research worker and the postgraduate student in probability and statistics and also to the mathematically inclined individual in another field interested in using ideas and results A thorough knowledge of the key notions of elementary probability theory is required to understand the book but specialised pure mathematical considerations have been avoided **Logic and Probability in Quantum Mechanics** Patrick

Suppes, 2013-11-11 During the academic years 1972 1973 and 1973 1974 an intensive seminar on the foundations of quantum mechanics met at Stanford on a regular basis The extensive exploration of ideas in the seminar led to the organization of a double issue of Synthese concerned with the foundations of quantum mechanics especially with the role of logic and probability in quantum mechanics About half of the articles in the volume grew out of this seminar The remaining articles have been solicited explicitly from individuals who are actively working in the foundations of quantum mechanics Seventeen of the twenty one articles appeared in Volume 29 of Synthese Four additional articles and a bibliography on the history and philosophy of quantum mechanics have been added to the present volume In particular the articles by Bub Demopoulos and Lande as well as the second article by Zanotti and myself appear for the first time in the present volume In preparing the articles for publication I am much indebted to Mrs Lillian O Toole Mrs Dianne Kanerva and Mrs Marguerite Shaw for their extensive assistance **Green's Function Methods in Probability Theory** Julian Keilson, 1965

Cognitive Implications for Raising Cross-language Awareness in Foreign Language Acquisition Tina Čok, 2023-04-08 This book focuses on the role of cross language awareness in foreign language learning especially unrelated languages as a third or additional language It brings together theoretical and empirical approaches to the study of foreign language acquisition with special emphasis on the role of discrepancies in the cognitive processing of typologically different languages The author defines unrelated languages in the context of methodological approaches to foreign language acquisition investigates cross language awareness competence in the context of unrelated language acquisition establishes cognitive approaches to foreign language acquisition and provides empirical evidence of discrepancies between languages using verbal aspect as an example

Finally the empirical results are put into practice through guidelines and recommendations for raising cross language awareness in third language acquisition The interdisciplinary understanding of foreign language acquisition presented in this book will make it appealing to a wide readership of graduate students faculty members and academic researchers in the fields of Second Language Acquisition SLA Third Language Acquisition TLA Psycholinguistics Cognitive Psychology and Education

Probability and Random Processes Geoffrey Grimmett, David Stirzaker, 2020-07-03 The fourth edition of this successful text provides an introduction to probability and random processes with many practical applications It is aimed at mathematics undergraduates and postgraduates and has four main aims US BL To provide a thorough but straightforward account of basic probability theory giving the reader a natural feel for the subject unburdened by oppressive technicalities BE BL To discuss important random processes in depth with many examples BE BL To cover a range of topics that are significant and interesting but less routine BE BL To impart to the beginner some flavour of advanced work BE UE OP The book begins with the basic ideas common to most undergraduate courses in mathematics statistics and science It ends with material usually found at graduate level for example Markov processes including Markov chain Monte Carlo martingales queues diffusions including stochastic calculus with It s formula renewals stationary processes including the ergodic theorem and option pricing in mathematical finance using the Black Scholes formula Further in this new revised fourth edition there are sections on coupling from the past L vy processes self similarity and stability time changes and the holding time jump chain construction of continuous time Markov chains Finally the number of exercises and problems has been increased by around 300 to a total of about 1300 and many of the existing exercises have been refreshed by additional parts The solutions to these exercises and problems can be found in the companion volume One Thousand Exercises in Probability third edition OUP 2020 CP

Combinatorial Methods in Discrete Distributions Charalambos A. Charalambides, 2005-06-10 A unique approach illustrating discrete distribution theory through combinatorial methods This book provides a unique approach by presenting combinatorial methods in tandem with discrete distribution theory This method particular to discreteness allows readers to gain a deeper understanding of theory by using applications to solve problems The author makes extensive use of the reduction approach to conditional distributions of independent random occupancy numbers and provides excellent studies of occupancy and sequential occupancy distributions convolutions of truncated discrete distributions and compound and mixture distributions Combinatorial Methods in Discrete Distributions begins with a brief presentation of set theory followed by basic counting principles Fundamental principles of combinatorics finite differences and discrete probability are included to give readers the necessary foundation to the topics presented in the text A thorough examination of the field is provided and features Stirling numbers and generalized factorial coefficients Occupancy and sequential occupancy distributions n fold convolutions of truncated distributions Compound and mixture distributions Thoroughly worked examples aid readers in understanding complex theory and discovering how theory can be applied to solve practical problems An

appendix with hints and answers to the exercises helps readers work through the more complex sections Reference notes are provided at the end of each chapter and an extensive bibliography offers readers a resource for additional information on specialized topics
